Introduction to Stakeholder Review Draft

Standard Development Process

The GHG Protocol Initiative follows a multi-stakeholder, consensus-based process to develop greenhouse gas accounting and reporting standards with participation from businesses, government agencies, nongovernmental organizations, and academic institutions from around the world.

This draft standard was developed between January and October 2009 by two technical working groups collectively comprised of over 70 members from a diversity of businesses, government agencies, NGOs, and academic institutions. The development was led and coordinated by WRI and WBCSD. A Steering Committee consisting of 25 organizations met three times between September 2008 and September 2009 to provide strategic and technical direction to the process.

Process Structure

19
20
21

1
2
3**Timeline**

November 2007	✓ Survey and consultations to assess need for new standards
September 2008	✓ Steering Committee Meeting #1 (Washington DC) ✓ Technical Working Group Meeting #1 (London)
January 2009	✓ Working groups begin drafting
March 2009	✓ Steering Committee Meeting #2 (Geneva)
June 2009	✓ Technical Working Group Meeting #2 (Washington DC)
August 2009	✓ Stakeholder webinar and comment period
October 2009	✓ Steering Committee Meeting #3 (Washington DC)
November - December 2009	✓ First draft of standards released for stakeholder review ✓ Five stakeholder workshops (in Berlin, Germany; Guangzhou, China; Beijing, China; London, UK; Washington, DC, USA) ✓ Stakeholder comment period on first drafts
January - June 2010	▪ Road testing by over 40 companies
Summer 2010	▪ Public comment period on second drafts
December 2010	▪ Publication of final standards

4

Process for Revising the Draft Standard5
6
7
8
9

In 2010, WRI and WBCSD, in collaboration with the Steering Committee and Technical Working Groups, will:

- 10 • Revise the draft standard based on feedback received during five stakeholder workshops and the stakeholder comment period (November 11 – December 21, 2009)
- 11 • Road test the draft standard with over 40 companies from a diversity of industry sectors and geographic locations during January to June 2010
- 12 • Revise the draft standard based on feedback received during road testing
- 13 • Circulate a second draft for public comment in mid-2010
- 14 • Revise the second draft based on feedback received
- 15 • Publish the final standard in December 2010

Part 1: General Requirements and Guidance for Scope 3 Accounting & Reporting

1. Introduction

The Greenhouse Gas Protocol Initiative (*GHG Protocol*) is a multi-stakeholder partnership of businesses, non-governmental organizations (NGOs), governments and others convened by the World Resources Institute (WRI), a U.S. based environmental NGO and the World Business Council for Sustainable Development (WBCSD), a Geneva, Switzerland-based coalition of over 200 international companies. Launched in 1998, the Initiative's mission is to develop internationally accepted accounting and reporting standards and guidelines for corporate greenhouse gas (GHG) emissions inventories and GHG projects, and to promote their use by businesses, governments, NGOs and other organizations.

The GHG Protocol Initiative has previously produced the following standards and guidelines:

- GHG Protocol *Corporate Accounting and Reporting Standard*¹ (2004)
- GHG Protocol for Project Accounting (2005)
- GHG Protocol *Land Use, Land-Use Change and Forestry Guidance for GHG Project Accounting* (2006)
- GHG Protocol *Guidelines for Quantifying GHG Reductions from Grid-Connected Electricity Projects* (2007)

The GHG Protocol launched a new initiative in 2008 to develop two new standards for:

- Product life cycle accounting and reporting
- Corporate scope 3 (value chain) accounting and reporting

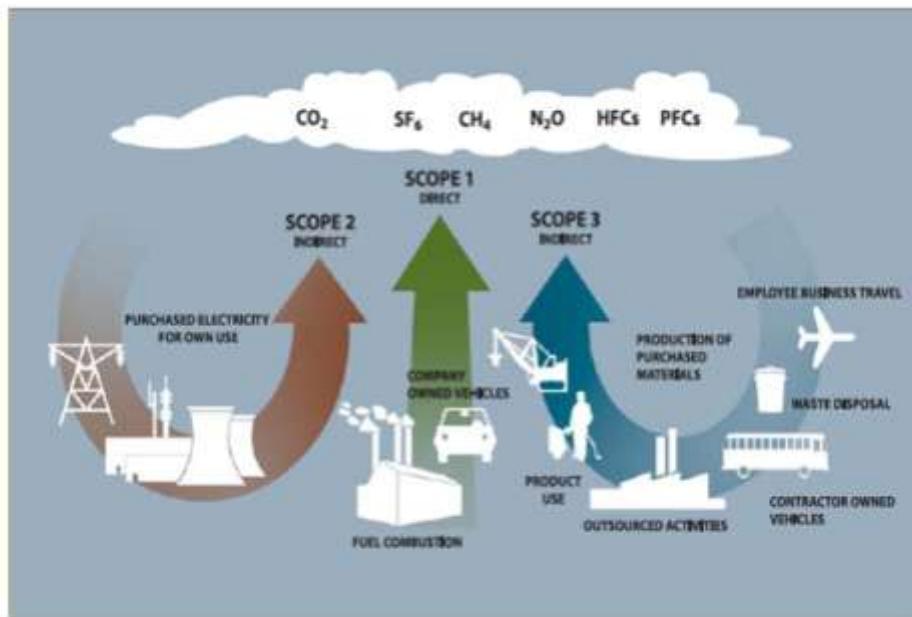

1.1 What is the motivation for new standards?

Since the launch of the *GHG Protocol Corporate Standard* in 2001 and its revision in 2004, business capabilities in the field of GHG accounting have grown significantly. Corporate leaders in this area are now adept at calculating emissions from GHG sources that they own or control (i.e., scope 1 emissions) and emissions from grid-sourced electricity and the other utility services of heat, steam and cooling (i.e., scope 2 emissions). See Figure 1 for an overview of the scopes.

¹ The GHG Protocol *Corporate Standard* is sometimes referred to as “the GHG Protocol.” The term GHG Protocol is an umbrella term for the collection of standards, tools and other publications provided by the WRI/WBCSD GHG Protocol Initiative.

1 As accounting expertise has grown, so has the realization that significant emission sources linked to
 2 business activities are often outside scopes 1 and 2. These other indirect emissions are defined in the
 3 Corporate Standard as "scope 3," or other indirect emissions. There is increasing interest by reporting
 4 companies and increasing demand from stakeholders for scope 3 emissions to be accounted and
 5 reported.
 6

7
 8 **Figure 1.1:** Overview of Scopes 1, 2 and 3

9 Companies are increasingly looking beyond their own boundaries and developing strategies to reduce
 10 emissions in their value chains and in the products they make and sell. The new GHG Protocol standards
 11 provide standardized methods to inventory the emissions of corporate value chains, taking into account
 12 impacts both upstream and downstream of the company's operations. By taking a comprehensive
 13 approach to GHG measurement and management, businesses and policymakers can focus attention on
 14 the greatest opportunities to reduce emissions within the full value chain, leading to more sustainable
 15 decisions about the products companies produce, buy, and sell.
 16

17 Many new drivers have emerged for scope 3 emissions reporting, including:
 18

- 20 • Corporate GHG management and reporting moving beyond companies' own operations (i.e.,
 21 scope 1 and 2), toward the full value chain to include upstream and downstream emissions
 22 (scope 3)
- 23 • Increasing focus on GHG emissions associated with production and consumption of goods and
 24 services
- 25 • Increasing awareness and management of climate-related risks in the value chain
- 26 • Stakeholder and investor requests for supply chain emissions and risk disclosure
- 27 • Increasing public reporting of scope 3 emissions
- 28 • Increasing business-to-business requests for GHG information through the supply chain
- 29 • Increasing emphasis on scope 3 emissions in corporate GHG management and reduction goals

31 Companies, investors and other stakeholders have called for standard approaches to accounting and
 32 reporting of scope 3 emissions due to the wide variety of emissions sources, calculation methods and
 33 lack of consistency of approach in scope 3 accounting.
 34

Both business and external stakeholders benefit from converging on a common accounting and reporting standard for GHG inventories. As common principles and standards become widely used, companies facing GHG accounting issues for the first time will have an easier time in calculating their GHG inventories than if confronted with a variety of different approaches to consider. For business, it will reduce costs if their GHG inventory is capable of meeting both internal and external information requirements. For external stakeholders, the use of a common standard improves the consistency, transparency and accessibility of reported information, making it easier to track and compare progress over time.

Like the GHG Protocol *Corporate Standard*, the goal of this standard is to provide a consistent and robust reporting methodology to support GHG emissions transparency and management by companies worldwide.

1.2 The business value of a GHG inventory that includes scope 3 emissions

For some organizations, scope 3 emissions represent the largest category of emissions – and the largest source of GHG risks and opportunities. (*To be developed further*)

1.3 The process used to develop the standards

The GHG Protocol Initiative is a multi-stakeholder, consensus-based process with participation from businesses, policymakers, NGOs, academics and other experts and stakeholders from around the world. More than 1,000 stakeholders are involved in the process to develop this standard.

The work was led by the WRI and WBCSD in conjunction with a Steering Committee. Several technical working groups consisting of a diverse group of participants developed guidelines on specific accounting topics. Draft guidelines will be reviewed by a stakeholder advisory group at various stages of the standard development process; pilot tested by several companies in multiple countries; and open for public comment before being finalized.

1.4 Relationship to the GHG Protocol Corporate Standard

This Scope 3 Accounting and Reporting Standard is a supplement to the GHG Protocol *Corporate Accounting and Reporting Standard, Revised Edition* (2004) and is meant to be used in conjunction with the existing *Corporate Standard*. Under the *Corporate Standard*, companies are required to report all scope 1 and scope 2 emissions, while reporting scope 3 emissions is optional.

Companies reporting their GHG emissions following the GHG Protocol have two reporting options, portrayed in Figure 1.2 below:

Figure 1.2: Organization's Reporting Options

Report in Conformance with the GHG Protocol Corporate Standard	Report in Conformance with the GHG Protocol Corporate Standard and Scope 3 Standard
<ul style="list-style-type: none">• Shall report all scope 1 and 2 emissions• May optionally report scope 3 emissions	<ul style="list-style-type: none">• Shall report all scope 1 and 2 emissions• Shall report scope 3 emissions (following the requirements/ guidance in this standard)

Companies should make and apply decisions consistently between both standards. For example, the selection of a consolidation approach (equity share, operational control or financial control) should be applied consistently across scopes 1, 2 and 3.

1
2 **1.5 Who should use this standard?**
3
4

5 This standard is designed for companies and organizations of all sizes in all economic sectors. It is
6 especially designed for companies with significant scope 3 emissions.
7

8 **1.6 Relationship to GHG Protocol Product Life Cycle Standard**
9

10 The GHG Protocol *Product Life Cycle Standard* was developed simultaneously within the same standard
11 development process as this standard. The two standards are complementary. Companies are
12 encouraged to use both standards to meet complementary but distinct goals. This standard contains
13 standards and guidance for developing a corporate-wide inventory of GHG emissions throughout the
14 value chain across all product categories and company activities. The *Product Standard* contains
15 standards and guidance for developing a GHG inventory of a single product across its life cycle. For
16 companies implementing both standards, a product level inventory will inform and support the
17 development of a corporate-wide scope 3 inventory. (*To be developed further*)
18

19 **1.7 GHG calculation tools**
20

21 To complement the standard and guidance provided here, a number of cross-sector and sector-specific
22 calculation tools are available on the *GHG Protocol* website (www.ghgprotocol.org).
23 These calculation tools provide step-by-step guidance together with electronic worksheets to help
24 companies calculate GHG emissions from specific sources or sectors.

25 **1.8 Navigating your way through this document**
26

27 This standard is divided into two parts. Part 1 provides general requirements and guidance for scope 3
28 accounting and reporting, applicable to all scope 3 emissions categories. The chapters in Part 1 are
29 organized according to the steps companies should follow in accounting and reporting scope 3 emissions,
30 such as defining business goals, mapping the value chain, setting boundaries, collecting data, calculating
31 emissions, reporting emissions, etc.
32

33 Part 2 provides guidance specific to individual scope 3 categories. The chapters in Part 2 are organized
34 by scope 3 categories, such as purchased goods and services, transportation and distribution, business
35 travel, waste generated in operations, leased assets, use of sold products, etc. Each chapter in Part 2
36 provides a description of the category, guidance on determining relevant emissions for each category,
37 guidance on calculating emissions for each category and case studies.
38

39 **1.9 Terminology: Shall, should and may**
40

41 The term “**shall**” is used in this standard to indicate what is required in order for a GHG inventory to be in
42 conformance with the *GHG Protocol Scope 3 Standard*. The term “**should**” is used to indicate a
43 recommendation, but not a requirement. The term “**may**” is used to indicate an option that is permissible
44 or allowable.
45

46 **1.10 Frequently asked questions**
47

- 48 • *Example Question:* How do I set my boundaries for scope 3 emissions?
49 • *Example Response:* See Chapter 5 "Setting Boundaries"
50
51
52
53

1
2 **1.11 Summary of Requirements in this Standard**

3
4 **Boundary Requirements** (see Chapter 5 for more information):

5 Companies shall account for and report:

- 6
- 7
- 8 • Emissions from the largest scope 3 sources that collectively account for at least 80% of total
9 anticipated scope 3 emissions (exclusive of Category 1 (Purchased Goods and Services – Direct
10 Supplier Emissions) and Category 14 (Use of Sold Products));
11 • The use phase emissions:
12 ○ All sold products that consume energy (fossil fuels or electricity) in the use phase;
13 ○ All sold fuels; and
14 ○ All sold products that contain and emit GHGs in the use phase (see Part 2, Section 14 for
15 more information); and
16 • All scope 1 and scope 2 emissions, as required by the *GHG Protocol Corporate Standard*.

17 Companies should account for and report any other relevant scope 3 emissions.

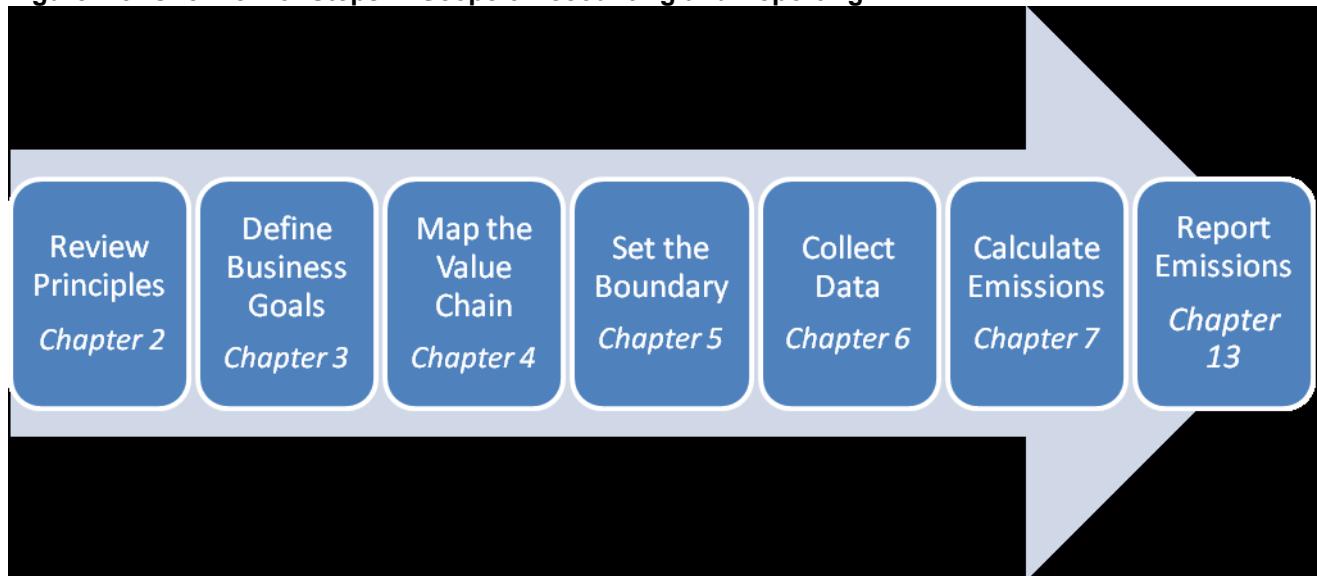

18
19 **Reporting Requirements** (see Chapter 13 for more information):

20 A public GHG emissions report that is in accordance with the *GHG Protocol Scope 3 Standard* shall
21 include the following information:

- 22
- 23
- 24
- 25 • A description of the company and inventory boundary, including an outline of the organizational
26 boundaries chosen and the chosen consolidation approach
27 • The reporting period covered
28 • Total scope 1 emissions, total scope 2 emissions, and all required scope 3 emissions, separately
29 reported for each scope
30 • Emissions data for all six Kyoto Protocol GHGs (CO₂, CH₄, N₂O, HFCs, PFCs, SF₆), separately in
31 metric tonnes and in tonnes of CO₂ equivalent
32 • Scope 3 emissions reported separately for each scope 3 category included in the inventory
33 • Methodologies used to calculate or measure emissions
34 • A description of the uncertainties of reported emissions data
35 • A list of scope 3 activities included in the report
36 • A description of the screening assessment approaches used and a description of their associated
37 uncertainties
38 • A list of excluded scope 3 emission sources with justification of their exclusion
39 • Emissions data reported separately for activities calculated using primary data and activities
40 calculated using secondary data, extrapolated data and proxy data
41 • A summary of data types used to calculate the inventory (e.g., the percentages of total scope 3
42 emissions calculated using primary data, secondary data, and extrapolated/ proxy data)

1
2

Figure 1.3: Overview of Steps in Scope 3 Accounting and Reporting

3
4
5
6

Each of these steps is described in detail in the following chapters.

1

2 **2. Accounting and Reporting Principles**

3
4 The GHG Protocol *Corporate Standard* provides the accounting and reporting principles that underpin
5 and guide GHG accounting and reporting for scopes 1, 2 and 3 emissions.

6
7 The five accounting and reporting principles described in the table below are further elaborated in the
8 GHG Protocol *Corporate Standard*.

- 9
- 10 • **Relevance:** Ensure the GHG inventory appropriately reflects the GHG emissions of the company and
11 serves the decision-making needs of users – both internal and external to the company.
 - 12 • **Completeness:** Account for and report on all GHG emission sources and activities within the chosen
13 inventory boundary. Disclose and justify any specific exclusions.
 - 14 • **Consistency:** Use consistent methodologies to allow for meaningful comparisons of emissions over
15 time. Transparently document any changes to the data, inventory boundary, methods, or any other
16 relevant factors in the time series.
 - 17 • **Transparency:** Address all relevant issues in a factual and coherent manner, based on a clear audit
18 trail. Disclose any relevant assumptions and make appropriate references to the accounting and
19 calculation methodologies and data sources used.
 - 20 • **Accuracy:** Ensure that the quantification of GHG emissions is systematically neither over nor under
21 actual emissions, as far as can be judged, and that uncertainties are reduced as far as practicable.
22 Achieve sufficient accuracy to enable users to make decisions with reasonable assurance as to the
23 integrity of the reported information.
- 24

1 3. Business Goals and Inventory Design

2 The ultimate goal of scope 3 accounting and reporting is to reduce global GHG emissions by reducing
3 emissions across corporate value chains.

4 Accounting and reporting of scope 3 emissions can serve a variety of business goals, including:

- 5 • **GHG management**, including identifying GHG reduction opportunities in the value chain; guiding
6 investment and procurement decisions; cost containment; managing climate-related risks in the value
7 chain including financial, regulatory, supply chain, product and technology, litigation, and reputational
8 risks; etc.
- 9 • **Performance tracking**, including setting a baseline, setting GHG reduction goals, and tracking
10 progress over time.
- 11 • **Engaging partners** in the value chain to expand GHG accountability, transparency and management
12 throughout supply chains such that additional companies in the value chain (e.g. customers,
13 suppliers, service providers, etc.) manage their scope 1, 2, and 3 emissions.
- 14 • **Public reporting** of GHG emissions to inform and meet the decision-making needs of stakeholders
15 (e.g., policy-makers, investors, purchasers, customers, suppliers, employees, NGOs, etc.), as well as
16 participation in corporate-level GHG reporting programs and registries.

17 Guidance on defining business goals

- 18 • *To be developed*

19 Case studies (*to be developed*)

- 20 • *Examples of companies reporting scope 3 emissions and their business goals (from different sectors
21 and with different business goals).*

4. Mapping the Value Chain

After defining the company's business goals, the next step in accounting for GHG emissions is to map the value chain. To the extent possible, companies should create a complete process map and/or a complete list of sources and activities in the company's value chain.² The purpose of mapping of the value chain is to identify the full range of possible scope 3 activities before a company determines which are most relevant and should be included in the scope 3 inventory.

To the extent possible, the process map and/or list of sources should reflect the complete value chain, including:

- All suppliers and customers;³
- All inputs (purchased goods and services) and outputs (sold goods and services); and
- All scope 3 activities, such as production of purchased goods and services, transportation & distribution of purchased and sold products including warehousing and retail, outsourced activities, waste disposal, use & disposal of sold products, business travel, employee commuting, etc.

Refer to Table 4.1 below for a list of the 16 categories of scope 3 emissions.

4.1 Introduction to Upstream and Downstream Emissions

This standard divides scope 3 emissions into upstream and downstream categories to help companies better understand their scope 3 emissions, to avoid double counting between companies in a supply chain, and to increase the consistency of reported GHG inventories. The distinction between the two categories is based on the financial transactions of the company. Upstream emissions are those related to purchased goods and services. Downstream emissions are related to sold goods and services.

- Upstream emissions are the emissions that occur in the life cycle of inputs (i.e., purchased or acquired goods, services, materials, and fuels), up to the point of receipt by the reporting company.⁴
- Downstream emissions are the emissions that occur in the life cycle of outputs (i.e., sold goods and services) subsequent to sale by the reporting company.
- Other scope 3 emissions are limited to employee activities such as commuting, which are neither purchased nor sold.

² Companies should strive for completeness in mapping the value chain, but it is acknowledged that a 100% complete process map and/or list of sources, suppliers, customers, etc. may not be feasible.

³ Because supply chains are dynamic and a company's suppliers and customers can change frequently throughout the reporting year, the list of suppliers and customers may represent a fixed point in time such as December 31 of the reporting year or a representative average over the course of the reporting year.

⁴ Upstream activities include external services used for the reporting company's production, e.g. disposal of waste generated in own operations, third party transportation and distribution, etc.

1

* Not otherwise included in categories 3-10

1 5. Setting the Boundary

2 5.1 Prioritizing Relevant Emissions

3 After mapping the value chain, companies should identify which scope 3 emissions are most relevant for the
4 company. Companies should prioritize scope 3 activities based on their relative size and significance, with a
5 view to prioritizing those scope 3 activities where the most significant GHG emissions and reduction
6 opportunities lie. These emissions sources are expected to be the focus of a company's GHG scope 3
7 reporting and reduction efforts.

8 Companies shall account for and report all relevant scope 3 emissions of the reporting company.

9 Following the principle of relevance, companies should ensure the GHG inventory:

- 10 • Appropriately reflects the GHG emissions of the company, and
- 11 • Serves the decision-making needs of users – both internal and external to the company.

12 The reported inventory must be relevant to the reporting company as well as to the company's stakeholders
13 and the users of reported emissions data.

14 Which scope 3 activities are most relevant differs by industry sector and by reporting company depending on
15 where a company's largest value chain GHG impacts lie (e.g., purchased materials, external transportation
16 and distribution, use of sold products, business travel, etc.). As a result, a determination of relevance must be
17 made on a company-by-company basis.⁵

18 Companies shall assess the relevance of each scope 3 category to determine whether each category must be
19 reported. Companies shall report emissions for each scope 3 category determined to be relevant. Companies
20 may additionally report emissions for other scope 3 categories.

21 In general, sources and activities the company targets for GHG emission reductions should be accounted for
22 and reported in the inventory. Doing so will allow the company to track and demonstrate progress toward its
23 GHG reduction goals.

24 5.2 Prioritizing Relevant Emissions Based on Size

25 Scope 3 activities shall be considered relevant if they are large (or expected to be large) compared to the
26 reporting company's other sources of emissions.

27 Companies should calculate initial estimates of all sources to gain a basic understanding of the relative
28 contributions of various scope 3 activities. Whether an individual scope 3 activity is significant in size is a
29 function of:

- 30 • Total anticipated scope 3 emissions, and
- 31 • The emissions from any single scope 3 activity.

32 Initial estimates should be conducted for each individual scope 3 category and rolled up to obtain an estimate
33 of total anticipated scope 3 emissions.

34 Each category of scope 3 emissions involves a separate screening method to estimate emissions. Part 2 of
35 this standard provides guidance on the use of screening methods and relevance tests for each scope 3
36 category.⁶

37 To determine which scope 3 activities are most significant in size, companies should follow these steps:

38 ⁵ Industry sectors may also coordinate to define common scope 3 activities that should be reported within a sector.

39 ⁶ Part 2 provides both emissions-based screening methods (based on estimated GHG emissions) and financial-based
40 screening methods (e.g., based on purchase spend) for various scope 3 categories.

- 1 1. Use screening methods to individually estimate the emissions from all scope 3 activities. See Part 2 of
2 this standard for examples of screening methods by scope 3 category.⁷
- 3 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated scope
4 3 emissions.
- 5 3. Rank all scope 3 activities from largest to smallest to determine which activities are most significant.

6 Companies shall account for and report:

- 9 • Emissions from the largest scope 3 sources that collectively account for at least 80% of total
10 anticipated scope 3 emissions (exclusive of Category 1 (Purchased Goods and Services – Direct
11 Supplier Emissions) and Category 14 (Use of Sold Products));
- 12 • The use phase emissions of:
 - 13 ○ All sold products that consume energy (fossil fuels or electricity) in the use phase;
 - 14 ○ All sold fuels; and
 - 15 ○ All sold products that contain and emit GHGs in the use phase (see Part 2, Section 14 for
16 more information); and
- 17 • All scope 1 and scope 2 emissions, as required by the GHG Protocol *Corporate Standard*.

19 Companies should disclose the percentage of total anticipated scope 3 emissions that has been accounted for
20 and reported.

22 **5.3 Prioritizing Relevant Emissions Based on Other Criteria**

24 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
25 emissions in terms of size⁸, companies should consider other criteria to determine whether additional scope 3
26 activities should be accounted for and reported.

28 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 30 1. There are potential emissions reductions that could be undertaken or influenced by the company
- 31 2. They contribute to the company's risk exposure (e.g., climate change related risks such as financial,
32 regulatory, supply chain, product and technology, compliance/litigation, reputational and physical
33 risks)
- 34 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or
35 civil society)
- 36 4. They are an outsourced activity that is typically insourced by other companies in the reporting
37 company's sector
- 38 5. They meet additional criteria developed by the company or industry sector

40 **5.3.1 Level of Influence**

42 In addition to the largest scope 3 activities, companies should prioritize and report scope 3 activities over
43 which they can exert influence and achieve GHG emission reductions.

45 By definition, scope 3 emissions are not owned or controlled by the reporting company, but are the scope 1
46 and 2 emissions of other companies such as suppliers, customers, waste management companies, shipping
47 companies, etc. Nevertheless, scope 3 emissions are a consequence of the activities of the reporting
48 company and companies often have the ability to influence GHG reductions upstream and downstream of
49 their operations.

51 Companies should assess their levels of influence over the scope 3 activities identified in the value chain
52 mapping process and rate them according to their ability to influence GHG reductions. Activities over which
53 the reporting company has the ability to influence reductions should be reported even if it falls below the
54 significance threshold established in section 5.2.

⁷ Part 2 also provides financial-based screening methods as an alternative to emissions-based screening methods.

⁸ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1 Table 5.1 provides an illustrative list of actions that companies can take to influence reductions in the value
 2 chain.

Table 5.1: Examples of Actions to Influence Scope 3 Reductions

Scope 3 Activity	Examples of Actions to Influence Reductions
Purchased goods and services - Direct supplier emissions	<ul style="list-style-type: none"> • Partner with suppliers to increase energy efficiency in their operations • Give preference to low GHG emitting suppliers over high GHG emitting suppliers • Include GHG reduction targets and policies in contractual agreements • Organize low-carbon supply chain partnerships, involving the whole value chain
Purchased goods and services – Cradle-to-gate emissions	<ul style="list-style-type: none"> • Substitute away from high GHG emitting raw materials toward low GHG emitting raw materials • Implement low-GHG procurement/purchasing policies • Encourage tier 1 suppliers to engage their tier 1 suppliers (i.e., the reporting company's tier 2 suppliers) and disclose these scope 3 emissions to the customer in order to propagate GHG reporting through the supply chain
Transportation and distribution of purchased goods	<ul style="list-style-type: none"> • Source materials from nearer locations if leads to net GHG reductions • Substitute toward lower emitting modes (e.g. marine transport) and away from higher emitting modes (e.g. air transport) • Optimize efficiency of transportation and distribution
Disposal of waste generated in operations	<ul style="list-style-type: none"> • Reduce tons of waste generated in operations • Implement re-use and recycling measures that lead to net GHG reductions
Employee commuting	<ul style="list-style-type: none"> • Locate offices/facilities near urban centers and public transit facilities • Create incentives for public transportation and disincentives for commuting by car • Reduce the number of days worked per week (e.g., 4x10 schedule instead of 5x8)
Business travel	<ul style="list-style-type: none"> • Encourage video conferencing and web-based meetings as an alternative to in-person meetings • Encourage more efficient travel, such as non-stop flights
Use of sold products	<ul style="list-style-type: none"> • Develop new low- or zero-emitting products • Increase the use phase energy efficiency of energy-consuming goods • Substitute away from products that contain GHGs • Decrease the use phase GHG intensity of the reporting company's product portfolio
Disposal of sold products	<ul style="list-style-type: none"> • Make products recyclable if leads to net GHG reductions • Implement product packaging measures that lead to net GHG reductions (e.g., decrease amount of packaging in sold products, develop new GHG saving packaging materials, etc.) • Implement re-use and recycling measures that lead to net GHG reductions

6
 7
 8
 9

1

2 **5.3.2 Risk exposure**

3

4 Companies should identify additional scope 3 activities that contribute to a company's risk exposure. Climate
5 change related risks include financial, regulatory, supply chain, product and technology, compliance/litigation,
6 reputational and physical risks. Some scope 3 sources and activities not determined to be significant in size in
7 section 5.2 are expected to contribute to a company's GHG risk exposure and should therefore be accounted
8 for and reported in the inventory.

9

10 **Table 5.2: Examples of climate change related risks**

11

Type of Risk	Examples
Regulatory	Mandatory emissions reduction legislation
Supply chain	Suppliers passing higher GHG-related costs to customers; supply chain business interruption risk
Product and technology	Competitors developing energy-efficient or climate-friendly offerings
Litigation	Lawsuits charging negligence, public nuisance, etc.
Reputation	Consumer or stakeholder backlash; negative media coverage
Physical	Damage to assets through drought, floods, storms, etc.

12

13 **5.3.3 Stakeholder requests**

14

15 Companies should identify additional scope 3 activities that are priorities of external stakeholders (e.g.,
16 suppliers, customers, investors, civil society, etc.) and account for these activities in the inventory.

17

18 **5.3.4 Outsourced activities**

19

20 Companies should identify all outsourced activities that are typically insourced by other companies in the
21 reporting company's sector. Such activities should be considered relevant scope 3 emissions and included in
22 the inventory.

23

24 Companies should identify all outsourced activities that were previously done in-house. Such activities should
25 be considered relevant scope 3 emissions and included in the inventory.

26

27 **5.3.5 Additional criteria developed by the company or industry sector**

28

29 Companies and their industry sectors should identify additional criteria for determining relevant scope 3
30 emissions that may be specific to the reporting company or the reporting company's sector. Additional scope
31 3 emissions should be included if determined to be relevant based on these criteria.

32

1

2 6. Collecting Data

3 After a company has identified its relevant scope 3 activities for inclusion in the boundary, the next step is to
 4 collect the necessary data to calculate a company's scope 3 emissions. This chapter provides a four step
 5 approach to collecting and evaluating data (see Figure 6.1).

6 **Figure 6.1:** Four-step process for collecting and evaluating data

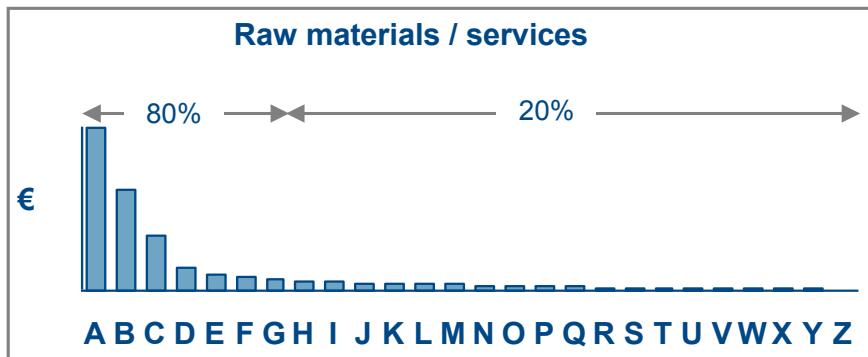

10

11 6.1. Prioritizing activities

12 Companies should collect data of the highest quality for each emissions source. However, the greatest effort
 13 should be focused on the activities that contribute most to total scope 3 emissions, based on the initial
 14 estimates calculated when setting the scope 3 boundary in Chapter 5.

15 **Box 6.1: Example of Prioritizing Emissions from Purchased Goods and Services**

16 When collecting data for purchased goods and services, a company may prioritize categories of purchased
 17 products by evaluating how much it spends on each purchase category. In the figure below, a company
 18 identifies the seven purchase categories (categories A-G) that collectively account for 80% of total emissions.
 19 Companies should also pay attention to smaller spend areas that may generate relatively high emissions.

25

26

27

28 6.2. Assessing data sources

29 Data includes directly measured emissions data, activity data and emission factors used to quantify
 30 emissions. The quality of reported emissions data depends on the quality of input data used to calculate
 31 emissions. The design of a corporate inventory system should facilitate the collection of high quality inventory
 32 data and the maintenance and improvement of collection procedures over time.

33

34

35

36

37

38

39

40

41

42

6.2.1 Available data types

There are two main types of data to use in calculating scope 3 emissions:

- Primary data
- Secondary data

1
2
3**Table 6.1: Types of Data**

Primary Data	Direct emissions measurements or activity data collected from specific sources within a company's operations or its supply chain.	The reporting company surveys its suppliers and collects product-level data or scope 1 and 2 emissions data from specific facilities in its supply chain.
Secondary Data	Data that are not collected from specific sources within a company's operations or its supply chain. Secondary data include industry-average data, data from literature studies, and data from published databases.	Data from life cycle inventory databases, literature studies, environmentally-extended input-output models ⁹ ; Intergovernmental Panel on Climate Change (IPCC) default emission factors; industry associations; etc.

4
5 When primary or secondary data of sufficient quality are not available, two estimation methods may be used
6 to fill data gaps:
7

- 8 • Use of extrapolated data
- 9 • Use of proxy data

10
11
12**Table 6.2: Estimation Methods to Fill Data Gaps**

Extrapolated Data	Primary or secondary data related to a similar (but not representative) input, process, or activity to the one in the inventory, which are adapted or customized to a new situation to make more representative (for example, by customizing the data to the relevant region, technology, process, temporal period and/or product).	There is secondary data available for electricity in Ukraine but not for electricity in Moldova. The company customizes the data for electricity in Ukraine to make it more representative of electricity in Moldova (e.g., by modifying the electricity generation mix).
Proxy Data	Primary or secondary data related to a similar (but not representative) input, process, or activity to the one in the inventory, which are directly transferred or generalized to the input, process, or activity of interest without being adapted or customized to make more representative.	There is secondary data available for electricity in Ukraine but not for electricity in Moldova. The company uses the data for electricity from Ukraine without modification as a proxy for electricity in Moldova.

13
14

⁹ Input-output data are derived from environmentally extended input-output analysis (IOA) which is the method of allocating GHG emissions (or other environmental impacts) associated with upstream production processes to groups of finished products by means of inter-industry transactions. The main data sources for IOA are sectoral economic and environmental accounts. Economic accounts are compiled by a survey of facilities on economic inputs and outputs and tax data from individual establishments. Environmental accounts are derived from (surveyed) fossil fuel consumption by industry and other GHG sources compiled in national emission inventories

1 As a general rule, companies should apply the following hierarchy of data types in collecting data:
2
3

- 4 1. Primary data
5 2. Secondary data
6 3. Extrapolated data
7 4. Proxy data
8

9 When collecting primary data from value chain partners, companies should obtain the most product-specific
10 data available, according to the following hierarchy:
11

- 12 1. Product-level data
13 2. Process-level data
14 3. Facility-level data
15 4. Business unit-level data
16 5. Corporate-level data
17

18 Companies shall disclose in the public report the types of data used to calculate the inventory.
19

20 Emissions calculated using primary data shall be reported separately from emissions calculated using
21 secondary data, extrapolated data and proxy data.
22

23 **Box 6.1: Rationale for prioritizing the use of primary data**
24

25 There are several reasons for prioritizing primary (company-specific) data over secondary (industry average)
26 data.
27

- 28 - Expanding primary data collection throughout the supply chain such that all companies engage their tier 1
29 suppliers will expand GHG transparency, accountability, and management throughout global supply
30 chains and expand the number of individual actors involved in GHG management.
31
32 - Observed data reflect operational changes from actions taken to reduce emissions, whereas secondary
33 data sources do not reflect operational changes undertaken by companies.
34
35 - Observed data provides transparency and accountability to the companies that have direct control over
36 emissions sources and have the greatest ability to achieve reductions through operational changes.
37

38 In general, primary data should be collected for all sources and activities the company targets for GHG
39 emission reductions. Collecting primary data will allow the company to track progress toward its GHG
40 reduction goals.
41

42 Companies should engage their tier 1 suppliers and encourage tier 1 suppliers to engage their tier 1
43 suppliers (the reporting company's tier 2 suppliers) to encourage a cascade of reporting throughout the supply
44 chain. Requesting scope 1, scope 2, and scope 3 data from a company's suppliers will help expand the
45 number of companies that are directly managing GHG emissions.
46
47

1
2

Table 6.3: Examples of Primary and Secondary Data by Scope 3 Activity

	Category	Primary Data (Company-Specific)	Secondary Data (Industry Average)
Upstream Scope 3 Emissions from Purchased Products	1. Purchased Materials and Services* – Direct (Tier 1) Suppliers	<ul style="list-style-type: none"> • Actual emissions data from suppliers' operations (either product-specific GHG data or scope 1 and 2 GHG data allocated to the product purchased based on mass, volume, revenue, etc.) 	<ul style="list-style-type: none"> • N/A
	2. Purchased Materials and Services* – Cradle-to-Gate Emissions	<ul style="list-style-type: none"> • Product-level cradle-to-gate GHG data specific to the supplier purchased from 	<ul style="list-style-type: none"> • Materials consumed x emission factors from published life cycle assessment (LCA) database
	3. Energy-Related Activities Not Included in Scope 2	<ul style="list-style-type: none"> • Actual T&D loss rate specific to grid • Actual power purchase data and emission rate for purchased power • Company-specific data on upstream emissions (e.g. extraction of fuels) 	<ul style="list-style-type: none"> • Average T&D loss rate (e.g. national average) • Average power purchase data • Average data on upstream emissions (e.g. secondary LCA database)
	4. Capital Equipment	<ul style="list-style-type: none"> • Actual energy use data from capital equipment manufacturer 	<ul style="list-style-type: none"> • Materials consumed x emission factors from published LCA database

Other Scope 3 Emissions	16. Employee Commuting	<ul style="list-style-type: none"> • Actual distance traveled x default emission factors 	<ul style="list-style-type: none"> • Estimated distance traveled x default emission factors

DRAFT FOR ROAD TESTING – JANUARY 2010

1 * Not otherwise included in categories 3-10
2

1 **6.2.2 Data Quality Criteria**

2

3 Companies should assess data sources using the following criteria. All data quality indicators should be used
 4 to describe primary data, while technological, temporal and geographic representativeness are the most
 5 relevant for secondary data.

6 Companies should use the following criteria as a guide when choosing data sources to obtain the highest
 7 quality data available for a given emissions activity.

9 **Table 6.4: Data Quality Criteria**

10

Criteria	Explanation
Technological representativeness	<ul style="list-style-type: none"> ■ Degree to which the data set reflects the actual technology(ies) used
Temporal representativeness	<ul style="list-style-type: none"> ■ Degree to which the data set reflects the actual time (e.g., year) or age of the activity or whether an appropriate time period is used (e.g., annual/seasonal averages may be appropriate to smooth out data variability due to factors such as weather conditions)
Geographical representativeness	<ul style="list-style-type: none"> ■ Degree to which the data set reflects actual geographic location of the activity, e.g., country or site
Completeness	<ul style="list-style-type: none"> ■ The degree to which the data represents the relevant activity ■ The percentage of locations for which site specific or generic data are available and used out of the total number that relate to a specific activity. Generally, a percent target is identified for the number of sites from which data is collected for each activity
Precision	<ul style="list-style-type: none"> ■ Measure of the variability of the data points used to derive the GHG emissions from an activity (e.g., low variance = high precision). Relates mostly to where direct measurements have been used.

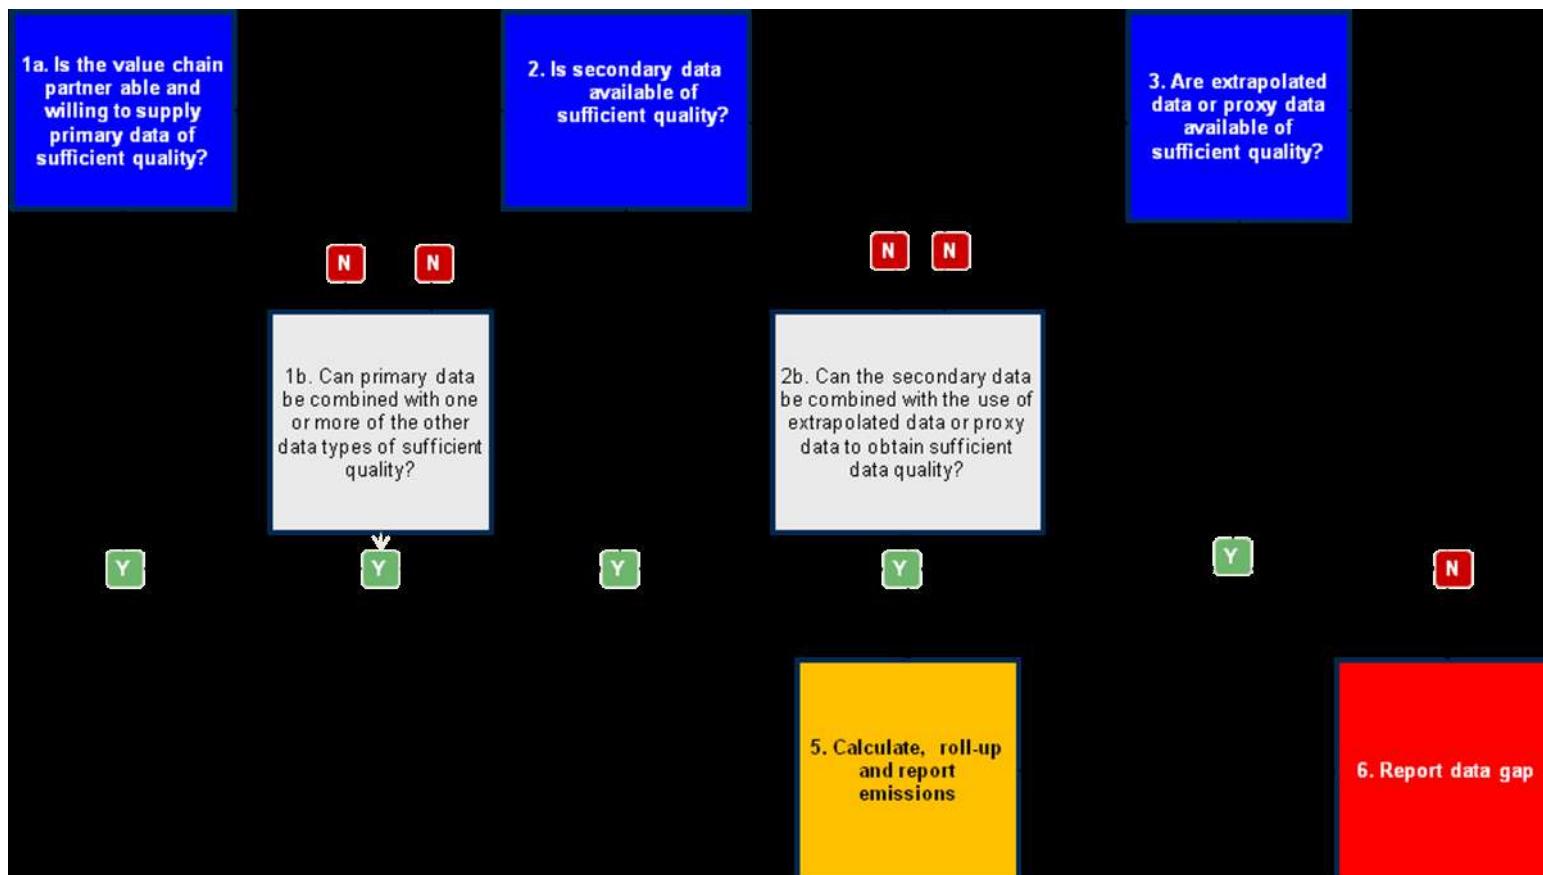

1 6.3. Collecting data

2 Companies should follow the decision tree in Figure 6.2 when choosing between primary data, secondary data, and extrapolated and proxy data.

3 Companies should apply the data quality criteria from Section 6.1 when determining the data quality of each data source. If data is unavailable or data quality is
4 insufficient for a given activity, companies should move to the next data type in the decision tree.

5
6
7
8 **Figure 6.2: Decision Tree for Collecting Data**

9
10

11

1 **6.3.1 Collecting primary data**

2
3 **Collect data using standardized formats:** Companies should establish robust data collection formats
4 that document the data sources to ensure the activity data is collected on an approved, consistent basis
5 to allow year on year and partner to partner comparability. A standardized format reduces the risk of
6 errors and provides transparent documentation to enable consistent recalculations. The data collection
7 format should include:

- 8 • Description of emission sources and scope
- 9 • Boundary details
- 10 • Reporting period
- 11 • Comparability with previous years (*if using primary data*)
- 12 • Trends evident in data
- 13 • Progress towards targets (*if applicable*)
- 14 • Discussion of uncertainties
- 15 • Description of events impacting data
- 16 • GHG calculation methodologies
- 17 • Ratio indicators – *for basic allocation if required*
- 18 • Details of emission factors
- 19 • Details of data source

21 **6.3.2 Use and Management of Confidential and Proprietary Data**

22 There are any number of situations when collecting and using data in a scope 3 inventory where the data
23 are considered confidential and/or proprietary to the provider of these data. Such source information can
24 take several forms, from direct emission measurement data to indirect data sources from which emission
25 data can be calculated or deduced.

26 Some organizations will provide data needed to perform GHG calculations without any use restrictions.
27 Other organizations may require that the data provided be protected from disclosure and not used for any
28 purpose other than that which is specified by the data provider. Frequently, use and disclosure of data
29 considered to be confidential and proprietary is governed by some form of “confidentiality” or “non-
30 disclosure” agreement. If so, specific terms of data use and disclosure are defined within the agreement.
31 Violating breach of use and disclosure provisions in legally binding documents can have serious legal
32 consequences, particularly if harm to the data source provider can be demonstrated as a result of
33 unauthorized disclosure.

34 Whenever data that represent a specific organization are to be used for a scope 3 inventory, it is
35 generally good practice to consult with the data provider to determine if there are any restrictions
36 regarding data use and disclosure, regardless of how the data were obtained. It is also good practice to
37 inform the data provider concerning how the data are to be used and ask for written permission to use
38 them for that purpose. Any restrictions on use of data or further disclosure need to be respected.

39 Another issue related to confidentiality is compliance with legal regimes with respect to anti-
40 competitiveness. The subject company can have multiple suppliers for similar components of products
41 and similar services. Each supplier’s data should be given the applicable standard of protection, subject
42 to local laws and regulations.

43 Both the reporting company and the value chain partner should have in place and enforce:

- 44 • Applicable standards of data protection for their information assets, particularly with a view
45 towards applicable protection for data used in implementing a Scope 3 greenhouse gas
46 emissions reporting process

- 1 • Sound privacy practices that protect the data of its employees, customers, suppliers, and others,
2 particularly with a view towards practices that protect the data used in implementing a Scope 3
3 greenhouse gas emissions reporting process.

- 4 • Applicable standards that enable compliance with anti-competitiveness laws in the relevant
5 countries, particularly with a view towards practices that protect the data used in implementing a
6 Scope 3 greenhouse gas emissions reporting process.

7 If the reporting company and the value chain partner do not have specific standards or practices in place,
8 they should consider developing such standards and practices and develop agreements to enforce these
9 standards and practices when implementing a scope 3 greenhouse gas emissions reporting process.

10 **6.3.2 Collecting secondary data**

11 **6.3.3 Addressing Data Gaps**

12 In most instances where data are missing, it should be possible to obtain sufficient information to provide
13 a reasonable estimate of the missing data. Therefore, there should be few, if any, data gaps. The highest
14 quality data should be used given resource constraints.

15 **Identifying data gaps**

16 Data gaps exist when there is no primary or secondary data that is specifically relevant to a given activity.

17 For example:

- 18 • Emissions factors or activity data may not exist for a specific activity
- 19 • Emissions factors or activity data may exist for a specific activity but has been generated in a
20 different region
- 21 • Emissions factors or activity data may exist for a specific activity but has been generated using a
22 different technology

23 **Filling data gaps**

24 Data gaps can be filled using:

- 25 • Extrapolated data, e.g., GHG emissions from the same or similar activities that have been
26 customized to a new situation, e.g., region.
- 27 • Proxy data, e.g., GHG emissions from the same activity but from a different locality or produced
28 using different technology or GHG emissions of a similar activity. This data is not modified in any
29 way.

30 Where data gaps have been filled using one of the above options, companies should report the
31 procedure(s) taken to fill the data gap. This will enable others to understand the steps taken to identify
32 other avenues to find the new sources of data.

33 **Extrapolation**

34 Extrapolation refers to the adaptation or customization of an existing dataset to the conditions of the
35 inventory being undertaken. Extrapolating data requires knowledge of both the existing situation and
36 those for the current inventory. It is likely that extrapolation is likely to yield more accurate results than the
37 use of proxy data.

1 Extrapolation can vary in the degree of customization applied. For example, adaptation of an existing
2 dataset may be limited to changing the electricity mix to match the country in which an input/product is
3 being manufactured. Alternatively more extensive adaptation may be applied where the key emissions
4 attributes of the product impact are identified (e.g. for a laptop, these may include weight, area of printed
5 circuit board, screen size, hard drive size, etc). An algorithm can subsequently be developed to apportion
6 impacts related to those attributes. Identifying the key emissions attributes and the subsequent algorithm
7 developed should be based on other relevant inventories for similar activities or stakeholder input where
8 inventories do not exist.
9

10 **Using proxy data**
11

12 Proxy data relates to a similar (but not representative) input, process, or activity to the one in the
13 inventory. Where data gaps exist, data relating to ‘similar’ activities can be used as ‘proxy’ or ‘surrogate’
14 data to fill these gaps. There are two ways to generate proxy data:
15

- 16 • Data transfer which is the application of data obtained in one situation to a different but similar
17 situation. The key issue is how to define “similar,” e.g., use of GHG emissions data from apple
18 production for pears
- 19 • Data generalization which is generalizing specific product datasets to more generic product types,
20 e.g., generalizing apples and oranges data to fruit

21 **6.4. Evaluating Data Sources**
22

23 **6.5 Case studies**
24

25

1

2 **7 Allocating Emissions**

3 **7.1 Introduction**

4
5 If different systems share a common process, the emissions associated with the shared process need to
6 be divided between (allocated to) the systems sharing it. For example, if multiple customers purchase
7 products from a common supplier manufacturing multiple products at one factory, the supplier's factory-
8 level emissions should be allocated to its various products.

9
10 There are two common situations where this can occur:

- 11
12
13 • When a process has multiple outputs
14 • When a process has multiple inputs

15
16 *Multi-output example:* Companies performing scope 3 inventories will often have suppliers that make
17 many products besides the ones purchased by the company. In this case, the suppliers' activity data or
18 emissions data need to be allocated among the various products (i.e. multiple outputs) so that customers
19 know the emissions attributable to the specific products they buy.

20
21 *Multi-input example:* To understand multi-input allocation, consider a company that makes component
22 parts that are combined with component parts from other companies to make a final product. In this case,
23 the scope 3 inventory of each component supplier should only include a portion of the emissions
24 associated with using and disposing of the final product, meaning that these emissions must be allocated
25 to the various component suppliers.

26 **7.2 Avoid Allocation if Possible**

27
28 Companies should avoid allocation if possible by obtaining product-level GHG data from value chain
29 partners in conformance with the GHG Protocol *Product Standard*.¹⁰

30
31 When collecting primary data from value chain partners, companies should obtain the most product-
32 specific data available, according to the following hierarchy:

- 33
34
35 1. Product-level data
36 2. Process-level data
37 3. Facility-level data
38 4. Business unit-level data
39 5. Corporate-level data

40
41 If product-level data is not available, companies should request GHG data from suppliers on the most
42 disaggregated level available (e.g., process- or production line-level data, facility-level data, business
43 unit-level data, etc.). For example, a customer may ask a supplier whether sub-metering if feasible for a
44 facility that produces two products to obtain energy or emissions data separately for each production line.

45
46
¹⁰ Refer to Chapter 8 of the GHG Protocol *Product Standard* for more information on allocation.

1
2 **7.3 Allocation Methods**
3

4 Companies should use one of the allocation methods provided in Table 7.1.
5

6 **Table 7.1: Allocation Methods**
7

Method	Definition
Physical Factors (e.g., mass, volume, energy, etc.)	Allocating the emissions of an activity based on an underlying physical relationship between the multiple inputs/outputs and the quantity of emissions generated.
Market Value	Allocating the emissions of an activity based on the market value of each output/product.

8 The allocation approach used in a scope 3 greenhouse gas inventory should be appropriate for the
9 objectives of the inventory and adhere to the principles of relevance, accuracy, completeness,
10 consistency and transparency.
11

12 The most appropriate allocation method depends on individual circumstances. Companies should use the
13 most appropriate allocation method for a given circumstance. For example, when allocating emissions
14 from freight transport, companies should allocate emissions according to mass or volume, depending on
15 whether the capacity of the vehicle is limited by mass or volume.
16

17 If more than one allocation method is possible given the types of data available, it is good practice to
18 perform sensitivity analysis using several allocation approaches, tested over a range of reasonable
19 scenarios. For instance, even if mass-based allocation is the primary allocation method used, it may be
20 helpful to examine how much difference it would make if market value were used instead, assuming a
21 reasonable range of economic values.
22

23 The choice of allocation method will also depend on the types of information available. Some suppliers
24 may develop allocated, cradle-to-gate data to characterize the specific materials purchased from them.
25 More often, however, companies performing scope 3 inventories will find that the data from suppliers is
26 limited to data aggregated at the production line, facility or corporate level.
27

28 Tables 7.2 and 7.3 describe the types of data that companies may encounter and outline factors to
29 consider in selecting allocation methods suited to the various types of data.
30

31 Companies shall disclose the allocation methods used. Companies should justify the methods used
32 where relevant.
33

1

3**Table 7.2: Allocation Methods Depending on Available Data**

Type of Data Provided By Supplier	Allocation Method	
	Physical Relationships	Market Value
Product (Good or Service)	No allocation required	No allocation required
Production Line/Processes that produce multiple products/services	If data cannot be sub-divided, allocate on a physical basis. Allocation based on industry benchmarks for the different product types may sometimes be feasible.	If most applicable or if physical data are unavailable.
Factory/Facility/Depot Business Segment	Allocate on a physical basis if products have similar inputs and processes. In some cases industry benchmarks may be useful for allocating among different products.	If most applicable or if physical data is unavailable.
Regional/National Subsidiary Corporate level	Unlikely to be applicable unless data covers products with similar inputs and processes. In some cases industry benchmarks may be useful for allocating among different products.	Most likely to be applicable, unless data covers products with similar inputs and processes.

4

1 Table 7.3: Allocation Methods By Scope 3 Category

Category	Likely Allocation Options
Purchased Goods & Services* – Direct Supplier Emissions	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes based on supplier knowledge of the processes • Allocate based on physical relationships (e.g. mass, process models, industry benchmarks) • Allocate based on economic value
Purchased Goods & Services* – Cradle-to-Gate Emissions	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes based on supplier knowledge of the processes • Allocate based on physical relationships (e.g. mass, process models, industry benchmarks) • Allocate based on economic value
Energy-Related Activities Not Included in Scope 2	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes based on supplier knowledge of the processes that use electricity • Allocate based on physical relationships (e.g. process models, industry benchmarks) • Allocate based on economic value
Capital Equipment	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes based on supplier knowledge of the equipment involved • Allocate based on physical relationships (e.g. knowledge of capital equipment requirements for the product) • Allocate based on economic value
Transportation & Distribution	<ul style="list-style-type: none"> • Avoid allocation by subdividing (i.e. identify those transport emissions attributable to the value chain of interest) • Allocate based on physical relationships (e.g. mass , volume, ton-km) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Business Travel	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes (i.e. identify travel specific to the value chain of interest) • Allocate based on physical relationships (e.g. person-km)
Waste	<ul style="list-style-type: none"> • Avoid allocation by subdividing processes based on supplier knowledge of the processes • Allocate based on physical relationships (e.g. mass, other physical properties, industry benchmarks)
Franchises	<ul style="list-style-type: none"> • Avoid allocation by subdividing the franchise operation • Allocate based on physical relationships (e.g. mass, volume, number of customers, other measures of franchise activity) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Leased Assets	<ul style="list-style-type: none"> • Avoid allocation by subdividing the leasing operation • Allocate based on physical relationships (e.g. mass, volume, other measures of leasing activity) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Investments	<ul style="list-style-type: none"> • Avoid allocation by subdividing the investments based on supplier knowledge • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Franchises	<ul style="list-style-type: none"> • Avoid allocation by subdividing the franchise operation • Allocate based on physical relationships (e.g. mass, volume, number of customers, other measures of franchise activity) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Leased Assets	<ul style="list-style-type: none"> • Avoid allocation by subdividing the franchise operation • Allocate based on physical relationships (e.g. mass, volume, other measures of leasing activity) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Transportation & Distribution	<ul style="list-style-type: none"> • Avoid allocation by subdividing (i.e. identify those transport emissions attributable to the value chain of interest) • Allocate based on physical relationships (e.g. mass, volume, tonne-km) • Allocate based on economic value and considering the GHG Protocol concepts of ownership and control
Use of Sold Products	<ul style="list-style-type: none"> • Avoid allocation by isolating the function of the company's product from those of other products used with the company's product. • Allocate based on physical relationships (e.g. mass, volume, hours used, other measures of product use) • Allocate based on economic value
Waste	<ul style="list-style-type: none"> • Avoid allocation by subdividing the waste-related emissions to isolate those attributable to the company's products • Allocate based on physical relationships (e.g. mass, volume, other properties that are related to emissions from waste) • Allocate based on economic value
Employee Commuting	<ul style="list-style-type: none"> • Avoid allocation by including only commuting of the company's own employees • Allocate based on physical relationships (e.g. person-km)

1

2 **12 Assurance**

3

4 **12.1 Introduction**

5

6 Performing assurance of a company's Scope 3 emissions provides confidence to users that the reported
7 information is fairly stated. In this standard, the term assurance is used in place of the term verification,
8 which is used in Chapter 10 of the GHG Protocol *Corporate Accounting and Reporting Standard*. The
9 terminology has been updated to keep current with best practices and is considered a more accurate
10 representation of this activity.

11

12 The purpose of this chapter is to:

13

- 14 1. Establish requirements for the type of assurance that may be performed and presented Scope 3
15 emissions in a company's GHG inventory in order for a company to demonstrate compliance with
16 this standard; and
- 17 2. Provide guidance on the key aspects of obtaining such assurance, and
- 18 3. Identify material Scope 3 categories which should be included if assurance is to be provided.

19

20 Assurance on Scope 3 emissions is only to be provided in conjunction with assurance over a company's
21 GHG inventory and should not be provided solely on Scope 3 emissions.

22

23 Assurance is when an assurance provider expresses a conclusion designed to enhance the degree of
24 confidence of the intended users (other than the preparer of the GHG inventory report) over the
25 measurement of the GHG inventory and the Scope 3 emissions included therein against defined criteria.
26 The defined criteria will include all required elements of this standard and the relevant optional elements.

27

28 Assurance is an objective assessment of the accuracy, completeness and presentation of a reported
29 GHG inventory and the Scope 3 emissions included therein and the conformity of the Scope 3 emissions
30 to the standard¹¹. Although assurance of Scope 3 emissions is still evolving, the emergence of reporting
31 and assurance standards, such as ISO14064, Part 3; ISO14065; PAS 2050: 2008 and this standard¹²,
32 should help the reporting of Scope 3 emissions to become more consistent and credible, with assurance
33 becoming more accessible and widely understood.

34

35 Assurance involves an assessment of the risks of material discrepancies in reported data. Such
36 discrepancies relate to differences between reported data and data generated from the proper application
37 of the standard. In practice, assurance involves the prioritization of effort by the assurance provider
38 towards the higher risk areas that have the greatest impact on overall accuracy, completeness and
39 presentation. However, an assurance provider cannot provide *absolute assurance* because there are
40 inherent limitations that affect the assurance provider's ability to detect material discrepancies. These
41 limitations result from factors such as the assurance provider testing less than 100% of inputs to the
42 Scope 3 emissions, and the fact that most assurance evidence is persuasive, rather than conclusive.
43 Rather, the assurance provider provides '*reasonable assurance*' or '*limited assurance*', depending on the
44 nature and extent of the assurance provider's work.

45

¹¹ Assurance is based on an assertion by management that their report is prepared in line with applicable criteria (refer to section 1.3.4 for further information on criteria). In representing that their GHG inventory is in accordance with applicable criteria, management implicitly or explicitly make an assertion regarding the quantification, presentation and disclosure of the inventory. Assertions provide the assurance provider with a framework that can be used when identifying the risks of material misstatement and gathering engagement evidence in response to identified risks.

¹² Refer to the Appendix for more information on these standards

1 The categories of risks related to potential errors, omissions and misrepresentation that are considered
2 by assurance providers are:

3 **Inherent Risk**

- 4 • Susceptibility of data to material misstatement, assuming there are no related internal controls

5 **Control Risk**

- 6 • The risk that a material misstatement could occur and not be prevented or detected on a timely
7 basis by the entity's internal controls. This risk is a function of the effectiveness of the design and
8 operation of internal control in achieving the entity's objectives relevant to the GHG inventory.
9 Some control risk will always exist because of the inherent limitations of internal controls.

10 **Detection Risk**

- 11 • The risk that the assurance provider will not detect a material misstatement that exists in a GHG
12 inventory. This risk is a function of the effectiveness of the procedures performed. It arises partly
13 from uncertainties that exist when less than 100% of the data is examined.

14 The process of developing an assurable GHG inventory including Scope 3 emissions is largely the same
15 as that for obtaining reliable and defensible data; i.e., designing and implementing adequate processes
16 and controls to support the obtaining of reliable data and documenting the approach and methodologies
17 used to allow appropriate interpretation of the Scope 3 emissions. Therefore, whilst this chapter should
18 provide insight to the assurance process and where an assurance provider is likely to focus their
19 procedures, it does not negate the need for companies to make a good faith effort to provide a complete
20 and accurate GHG inventory including Scope 3 emissions.

21 **Level of assurance**

22 The level of assurance refers to the degree of confidence the intended user of the assurance conclusion
23 can gain from the outcome of the assurance evaluation. The level of confidence that can be gained is
24 provided in the wording of the assurance conclusion, which reflects the conclusion the assurance provider
25 can reach based on the reduction of the assurance risk. Assurance engagement risk is the risk that the
26 practitioner expresses an inappropriate conclusion when the subject matter information is materially
27 misstated.

28 There are 2 levels of assurance:

Assurance opinion	Limited	Reasonable
Nature of opinion	Negative opinion given - moderate assurance	Positive opinion given - high assurance
Example of report wording	<i>"Based on our review, we are not aware of any material modifications that should be made to management's GHG report/ assertion based on the criteria set forth in the accompanying management's assertion."</i>	<i>"In our opinion management's report/assertion is fairly stated, in all material respects, based on the criteria set forth in the accompanying management's assertion."</i>

34 The level of assurance required will dictate the amount of evidence required. An assurance provider will
35 only ever provide confirmation to a reasonable assurance level, never absolute, as 100% of inputs to the
36 GHG Inventory are not tested.

37 The objective of a limited assurance engagement is a reduction in assurance engagement risk to a level
38 that is acceptable in the circumstances of the engagement, but where the risk is greater than for a

reasonable assurance engagement. The assurance provider expresses their opinion in a negative form – “*From what we have looked at, nothing has come to our attention*”. The opinion is negative as it is restricted to the specific areas assured and doesn’t state that the information is free from material misstatement but that the assurance procedures performed have highlighted no errors.

The objective of a reasonable assurance engagement is a reduction in assurance engagement risk to an acceptably low level in the circumstances of the engagement. The assurance provider expresses their opinion in a positive form – ‘*is free from material misstatement*’. Reasonable assurance gives a high, but not absolute, level of assurance, expressed positively in the assurance report as reasonable assurance, that the GHG Inventory is free from material misstatement.

12.2 Types of Assurance

While assurance in accordance with the Scope 3 standard is not required, companies are encouraged to seek assurance. However, if assurance is sought, material Scope 3 categories within the company's control should be included and any material categories not included should be disclosed.

Companies may follow either of the following types of assurance:

1. Internal (or "self") assurance – Persons from within the organization but independent of the GHG inventory determination process, conduct internal assurance;
2. External assurance – Persons from a certification or assurance body independent of the GHG inventory determination process, conduct independent external assurance.

Assurance providers, whether internal or external to the organization¹³, should be sufficiently independent of any involvement in the determination of the GHG inventory or development of any declaration and have no conflicts of interests resulting from their position in the organization, such that they can exercise objective and impartial judgment.

The assurance opinion shall be expressed in the form of either reasonable assurance or limited assurance¹⁴. Refer to glossary for explanation of these terms.

When reporting a GHG inventory including Scope 3 emissions, the assurance opinion shall also be presented, including or accompanied by a clear statement identifying whether internal or external assurance has been obtained.

Where internal assurance providers are used, their relevant competencies and reasons for selecting them as assurance providers shall be disclosed in the GHG inventory report or assurance statement.

12.3 Objectives of Assurance

For the company seeking assurance

Before commissioning assurance, a company should clearly define its objectives and decide whether they are best met by internal or external assurance. Common reasons for undertaking assurance include:

- Increased credibility of a publicly reported GHG inventory and progress towards reduction targets, leading to enhanced stakeholder trust

¹³ Although either of the above types of assurance permitted, benefits of external assurance are outlined in the guidance section.

¹⁴ At the time of writing, reasonable assurance is not widely provided for GHG reporting (this is the case for both corporate and product GHG inventories). This is largely due to immature controls around GHG data that often results in the time requirement and hence cost of a reasonable assurance engagement being prohibitive. However, over time and as controls improve, it is expected that reasonable assurance will become more commonplace.

- 1 • Increased senior management confidence in reported information on which to base investment
2 and target setting decisions
- 3 • Improvement of internal accounting and reporting practices (e.g., calculation, recording and
4 internal reporting systems, and the application of GHG inventory accounting and reporting
5 principles), and facilitating learning and knowledge transfer within the company
- 6 • Preparation for mandatory assurance requirements of GHG inventory programs which include
7 Scope 3 emissions.

8 For the assurance providers

9 When conducting an assurance engagement over a GHG inventory the objective of the assurance
10 provider is:

- 11 • To obtain reasonable assurance about whether the GHG inventory including scope 3 emissions,
12 as a whole is free from material misstatement; or
- 13 • To obtain limited assurance that nothing has come to their attention that causes them to believe
14 that the GHG inventory including scope 3 emissions, is materially misstated; and
- 15 • To report on the GHG inventory including scope 3 emissions, in the form of an assurance opinion,
16 in accordance with their findings and the level of assurance they have been engaged to provide.

17 **12.4 Timing of Assurance**

18 The engagement of an assurance provider can occur at various points during the GHG inventory
19 preparation and reporting process. Some companies may establish a semi-permanent internal assurance
20 team to facilitate that GHG inventory data including scope 3 emissions standards are being met and
21 improved on an on-going basis.

22 Assurance procedures that occur during a reporting period allows for any reporting deficiencies or data
23 issues to be addressed before the final fieldwork is carried out. This may be particularly useful for
24 companies preparing high profile public reports. However, companies should be aware that:

- 25 • Some procedures can only be performed when the final GHG inventory has been prepared; and
- 26 • The related assurance on the final GHG inventory including scope 3 emissions, should be
27 completed before conformity with the standard can be confirmed.

28 **12.5 Selecting an Assurance Provider**

29 An assurance provider, whether internal or external, should apply the principles listed in Box 12-1.

30 While assurance is often undertaken by an independent, external assurance provider this need not be the
31 case. Many companies interested in improving their GHG inventory reporting including Scope 3
32 emissions may subject their information to internal assurance. In this case, the personnel should at least
33 be independent of those undertaking the GHG inventory accounting and reporting process. Both internal
34 and external assurance should follow similar procedures and processes. For external stakeholders,
35 external assurance is likely to significantly increase the credibility of the GHG inventory. However, internal
36 assurance can also provide valuable assurance over the reliability of information and can be a worthwhile
37 learning experience for a company prior to commissioning external assurance. It can also provide
38 external assurance providers with useful information. Consequently, the use of external assurance as a
39 final step is a decision at the discretion of the company.

40 A credible and competent GHG inventory assurance provider has:

- 41 • Deep assurance expertise and proven previous experience and competence in undertaking
42 assurance engagements under recognized assurance frameworks. This includes making

- 1 objective judgments on fact based material issues, assessing the quality of data and the
2 application of Scope 3 methodology rules;
- 3 • Robust assurance methodologies including the ability to assure data and information systems;
- 4 • Ability to assess the sources and the magnitude of potential errors, omissions and
5 misrepresentations for further assurance activities.
- 6 • Knowledge of the company's activities, industry sector, suppliers and products and understanding
7 of Scope 3 principles, methodologies and limitations, including (but not limited to) knowledge of
8 life cycle assessment, scope, unit of analysis (functional unit), system boundary, allocation, and
9 calculation methodologies including LCA software (e.g. databases and modeling software); and
- 10 • Objectivity, impartiality, credibility, independence and professional skepticism to challenge data
11 and information.

12 External assurance

13 There are several standards, accreditation schemes and frameworks in place to assist companies in
14 selecting a credible and competent external assurance provider. For example:

- 15 • Various accreditation schemes are currently available to GHG assurance providers world-wide,
16 particularly for regulated schemes, for example UK-ETS, EU-ETS, CDM/JI. Typically, these
17 accreditations are against the requirements established in ISO 14065. Accreditation to ISO 14065
18 indicates that the organization performing the assurance has been independently tested against
19 specified criteria (including competence) by a recognized and authorized body (although the
20 company engaging the assurance provider may wish to ensure that the scope accreditation
21 covers their specific requirements).
- 22 • Professional, registered auditors in public practice are required to comply with ISAE 3000, the
23 International Framework for Assurance Engagements, the Quality Control Standard ISQC1 and
24 other ethical requirements. Assurance provided under these standards also gives high credibility
25 to the assurance provider.

26 Companies should use their discretion to choose an assurance provider to obtain assurance over their
27 GHG inventory and should use the most appropriate assurance provider for their circumstances. All
28 credible assurance practitioners should follow the principles established in recognized standards, such as
29 ISAE 3000 or ISO 14065, and be able to demonstrate this to their clients.

30 When choosing an assurance provider, companies should consider the knowledge and qualifications of
31 the individual(s) conducting the assurance as well as broader experience and/or accreditation of the
32 organization they represent. Effective assurance often requires a mix of specialized skills, not only at a
33 technical level (e.g., engineering expertise) but also at a business level (e.g., assurance, industrial sector
34 and information system specialists). This includes at least one member of the assurance team having
35 sufficient knowledge, understanding and experience of Scope 3 analysis sufficient to be able to
36 objectively assess the suitability of the criteria.

37 Companies may also wish to ensure that the lead assurance provider assigned to them is appropriately
38 qualified and experienced. The lead assurance provider should have the ability and experience to
39 manage an engagement including planning, managing risk, assurance execution, objective judgment and
40 drawing appropriate conclusions.

41 Advantages to a company of engaging an external credible and competent assurance provider include:

- 42 • Confidence that the independence, impartiality, integrity, management and competence of
43 personnel employed by the assurance provider are scrutinized by an independent body against
44 established standards or requirements;
- 45 • Increased credibility over reported Scope 3 emissions;
- 46 • Improved management confidence in reported information on which to base strategic, investment
47 and reduction target decisions; and
- 48 • Enhanced stakeholder confidence when making investment and/or purchasing decisions.

1
2 Internal assurance
3

4 If using an internal assurance provider, companies should seek a suitable independent team who can
5 demonstrate the most relevant experience for the task. The guidance above relating to external
6 assurance providers can be a useful aid in identifying the appropriate skills. For example, employees
7 within internal audit who have a scientific background and/or experience with corporate GHG inventories
8 may be considered suitable or site engineers experienced with environmental site assessment audits.
9

10
11 **Box 122-1: Principles for Assurance Providers**
12

An assurance provider should apply the following principles.

Competency and due care

Personnel have the necessary skills, experience, supporting infrastructure and capacity to effectively complete validation or assurance activities.

Confidentiality

Confidential information obtained or created during assurance activities is safeguarded and not inappropriately disclosed.

Impartiality

Decisions are based on objective evidence obtained through the assurance process and not influenced by other interests or parties.

Integrity

Integrity is a prerequisite for all those who act in the public interest. It is essential that assurance providers act, and are seen to act, with integrity, which requires not only honesty but a broad range of related qualities such as fairness, candor, courage, intellectual honesty and confidentiality. Integrity includes assessing and, if appropriate, disclosing whether any conflicts of interest arise should an assurance provider take on a GHG inventory engagement including Scope 3 emissions.

Objectivity

Objectivity is the state of mind which has regard to all considerations relevant to the task in hand but no other. It is sometimes described as 'independence of mind'. The assurance opinion is based on evidence collected through an objective assessment of the GHG inventory engagement including Scope 3 emissions.

13
14 **12.6 Establishing Assurance Parameters**
15

16 The scope of assurance and the level of assurance it provides may be influenced by the company's wider
17 goals and/or any specific jurisdictional requirements. It is possible to assure the entire GHG inventory
18 including all Scope 3 emissions or material categories of it, although the assurance providers will need to
19 satisfy themselves that assurance over only a part of Scope 3 emissions is meaningful to the user and
20 includes all material categories within the company's sphere of influence. The assurance process may
21 also examine more general managerial issues, such as quality management procedures, managerial
22 oversight, data processes and controls, knowledge and experience of personnel, clearly defined
23 responsibilities, segregation of duties and internal review procedures.
24

25 The company and assurance provider should reach agreement on the level of assurance required:
26 reasonable assurance, or limited assurance.
27

28 Where an assurance provider external to the company is used, the terms of the engagement should be
29 agreed in a contract in advance (before the commencement of the assurance procedures). This contract
30 confirms the intended use of the assurance opinion. It is also important that the respective
31

1 responsibilities of management of the company and the assurance provider are clearly defined and
2 understood.

3
4 The company is responsible for determining the assurance criteria, and for establishing policies and
5 procedures to measure, record and report the GHG inventory including Scope 3 emissions in accordance
6 with those criteria. The assurance provider's responsibility is to form an independent opinion, based on
7 their assurance procedures, on whether the GHG inventory is fairly stated in accordance with the criteria,
8 to the extent of the level of assurance sought. Because the assurance provider is required to be
9 independent, they should have no involvement in setting the criteria, establishing processes in relation to,
10 or executing any part of, the GHG inventory.

11
12 Clearly defined criteria are not only important to the company and assurance provider, but also for
13 external stakeholders to be able to make informed and appropriate decisions. Criteria communicate the
14 basis of preparation used to measure the GHG inventory and often expand on a general criteria to cause
15 it to be measurable. Criteria are required as a frame of reference to achieve consistency in interpretation
16 and understanding of the assurance opinion. It is for this reason that criteria need to be made available to
17 all users of the assurance report.

18 Assurance providers will assess the suitability of the criteria and in doing so will assess whether:

- 19
20
21 • All standard requirements are included
22 • The system, boundaries and functional unit are clearly defined
23 • Assumptions and estimations made are appropriate in the circumstances
24 • Selection of primary and secondary data is appropriate and methodologies used are adequately
25 disclosed (with references to external sources where applicable)
26 • Exclusions are reasonable in the context of the whole.

27 12.7 The Concept of Materiality

28
29 Information is considered to be material if, by its inclusion or exclusion, it can be seen to influence
30 decisions or actions taken by users of it. A **material discrepancy** is an error (for example, from an
31 oversight, omission, miscalculation or fraud) that results in a reported quantity or statement being
32 sufficiently different from the true value or meaning to influence a user's decisions. In order to express an
33 opinion on management's report/ assertion over the data or information, an assurance provider needs to
34 form a view on the materiality of identified errors or uncertainties, individually and in aggregate. While the
35 concept of materiality involves professional judgment and includes consideration of both quantitative and
36 qualitative aspects, the point at which a discrepancy becomes material (**materiality threshold**) can
37 usually be pre-defined - for example, exceeds 5% of the total GHG inventory being assured. However,
38 such a threshold does not negate the principle of completeness and companies need to make a good
39 faith effort to report a complete and accurate GHG inventory. For cases where emissions have not been
40 estimated, or estimated at an insufficient level of quality, it is important that this is transparently
41 documented and justified.

42
43 Consequently, assurance providers may adjust this materiality threshold during the course of their
44 procedures if, for example, omissions are identified. Note - A materiality threshold is not the same as "de
45 minimus" emissions, or a permissible quantity of emissions that a company can leave out of a GHG
46 inventory.

47
48 Materiality is used by the assurance provider during the planning process and then again in evaluating
49 the evidence obtained:

50
51 Planning: The concept of materiality is used when designing the assurance approach and
52 sampling plans. A materiality threshold provides guidance to assurance providers on
53 what may be an immaterial discrepancy so that they can concentrate their work on
54 areas that are more likely to lead to materially misleading errors.

Evaluation: The concept of materiality is also used to assess whether errors and omissions identified during the course of the assurance process that, if uncorrected or omitted, would significantly misrepresent a GHG inventory to intended users, thereby inappropriately influencing their conclusions or decisions.

Understanding how assurance providers apply a materiality threshold will enable companies to more readily establish whether any errors in their inventory are likely to raise questions of materiality. Materiality thresholds may also be outlined in the requirements of a specific GHG inventory program or determined by an assurance standard, depending on who requires the assurance and for what reason.

Box 122-2: Understanding Qualitative Aspects of Materiality

An assurance provider can be expected to assess errors within the full context of what is being assured and what a user may consider material, for example:

- Where a company has a reduction target to reduce a product's GHG inventory by a set amount or percentage. Clearly, if the company's target is a 5% reduction, then the materiality threshold should be set at such a level to enable them to conclude whether or not this has been achieved; or
- Where a regulatory environment requires reduction by a certain amount. A material error would include those that may be small in isolation but would mean the difference between compliance and non-compliance.

Assessing the risk of material discrepancy

Assurance providers need to assess the risk of material discrepancy for each component of the data collection, calculation and reporting process. This assessment is used to plan and direct the assurance process.

In assessing this risk, they will consider a number of factors, including:

- Complexity and nature of the GHG inventory
- The technical knowledge and expertise of the person(s) compiling the GHG inventory
- The structure of the organization and the approach used to assign responsibility for the collection, calculation and reporting processes associated with GHG inventories
- The approach and commitment of management to the collection, calculation and reporting processes associated with GHG inventories
- Development and implementation of policies, processes, controls and procedures for collection, calculation and reporting (including documented methods explaining how data is generated and evaluated)
- Processes, controls and procedures used to check and review calculation methodologies
- Complexity and reliability of the computer information system used to process the information
- The state of calibration and maintenance of meters, and the types of meters used
- The defined system boundary for the supply chain
- The allocation methodology and assumptions made
- Reliability and availability of input data, including primary and secondary
- The nature of assumptions and estimations used
- Aggregation of data from different sources
- The extent to which reduction and/or competitive claims are made over the GHG inventory

- 1 • Other assurance processes to which the systems and data are subjected (e.g., internal audit,
2 external reviews and certifications).

4 **12.8 Preparing for GHG Inventory Assurance, Including Scope 3 Emissions**

5 General preparation

8 Irrespective of whether the assurance provider is internal or external, assurance providers' needs are
9 similar. The presence of a transparent, well-documented system (referred to as an audit trail) is crucial for
10 the achievement of assurance. Sufficient and appropriate evidence needs to be available to support the
11 GHG Inventory including Scope 3 emissions subject to assurance, i.e. the assurance provider will need to
12 see evidence that supports the inputs to the calculation, supporting justification for assumptions made
13 etc. The evidence should be sufficient to demonstrate consistent application of the criteria. Information
14 required by the assurance provider may include (but not be limited to) the following:

- 16 • Information about the company, its structure, geographic location main activities and controls
17 culture and environment
- 18 • Details of the supply chain and criteria
- 19 • Documented processes or procedures for identifying sources of GHG emissions for the Scope 3
20 categories emissions included in the GHG inventory within the company and along the supply
21 chain
- 22 • Changes since any previous assurance to the system boundaries, processes, assumptions, data
23 sources or other elements that affect the GHG inventory
- 24 • Information on other assurance processes to which the systems and data are subjected (e.g.
25 internal audit, external reviews, assurance over part of the supply chain and/or certifications)
 - 26 ○ Both primary and secondary data and evidence used for calculating Scope 3 categories
27 emissions included in the GHG inventory emissions.
- 28 • Description of how Scope 3 categories emissions included in the GHG inventory emissions data
29 has been calculated:
 - 30 ○ Emission factors and other parameters used and their justification
 - 31 ○ Assumptions on which estimations are based
 - 32 ○ Information on the measurement accuracy of meters and weighbridges etc., (e.g.,
33 calibration records), and other measurement techniques
 - 34 ○ Documentation on what, if any, GHG inventory sources or activities are excluded due to,
35 for example, technical or cost reasons
- 36 • Information gathering process:
 - 37 ○ Description of the procedures, systems and controls used in collecting, documenting,
38 processing and collating GHG Inventory emissions data
 - 39 ○ Description of quality control procedures applied (e.g. internal audits, comparison with
40 previous years' data, peer calculation or review)
- 41 • Other information:
 - 42 ○ List of (and access to) persons responsible for collecting GHG inventory emissions data
43 at each site, at corporate level and suppliers
 - 44 ○ Information on uncertainties, qualitative and if available, quantitative.

46 A company, particularly where they have not yet implemented systems and controls for routinely
47 accounting and recording GHG inventory emissions data, may wish to obtain a pre-assurance
48 assessment from the assurance provider as to whether their processes and controls are sufficiently
49 robust for assurance. Under these circumstances, assurance providers may make recommendations on
50 how current measurement, data collection and collation procedures and controls can be improved to
51 enable an assurance engagement to commence.

52 Companies are responsible for ensuring the existence, quality and retention of documentation so as to
53 create an audit trail of how the GHG inventory was compiled. Companies should be mindful of this when

1 designing and implementing GHG inventory data processes and procedures including Scope 3
2 emissions.

3

4 Site / supply chain visits

5 Assurance providers may need to visit a number of sites/supply chain organizations to enable them to
6 obtain sufficient, appropriate evidence in order to form a conclusion over the GHG inventory depending
7 on the complexity of the organization, the scope of the reporting covered, and the level of assurance
8 required from assurance. The sites / supply chain organizations visited may be selected on the basis of
9 their proportional importance in the context of the whole GHG inventory and Scope 3 emissions
10 categories.

11 The reporting company's internal Scope 3 emissions, such as employee commuting should be assured
12 based on a sound measurable methodology such as an employee questionnaire or survey which can be
13 subjected to assurance procedures and which reflect a representative sample. In addition to that, the
14 company is expected to make a reasonable effort to obtain Scope 3 GHG emissions data which has been
15 subject to assurance from both direct Tier 1 suppliers and business customers utilizing its influence or
16 superior position in business. Information, such as employee commuting, highlights the difficulty of going
17 beyond limited assurance to reasonable assurance when the systems used to gather the data and the
18 data itself is subject to compromise.

19 To prepare for assurance, the company should include in its contracts a stipulation for site visits for
20 assurance of Tier1 suppliers and business customers.

21 Assurance providers may include visits to the site of:

- 22
- 23
- 24
- 25
- Internal departments where GHG data are tracked
 - Upstream Tier-1 supplier
 - Downstream customer
 - Others, if applicable

26 Value chain partners further upstream/downstream may be difficult to be assured by an assurance
27 provider. In such cases, business to business data exchange is important and useful in order to avoid
28 distortion of data allocation and to easily handle the data assured by another assurance provider as
29 evidence and reference in the company's assurance process.

30 The selection of sites / supply chain organizations to be visited should be based on consideration of a
31 number of factors, which may include the:

- 32
- 33
- 34
- 35
- 36
- 37
- 38
- 39
- 40
- 41
- 42
- 43
- 44
- 45
- 46
- 47
- Nature of the product/service
 - Nature of the Scope 3 emissions included in the GHG inventory emission sources at each site/supply chain organization
 - Complexity of the emissions data collection and calculation procedures
 - Percentage contribution to total GHG inventory emissions from each site / supply chain organization
 - Risk that the data from sites / supply chain organizations will be materially misstated
 - Competencies and training of key personnel
 - Adequacy and quality of evidence supplied remotely (e.g. electronically or by post); and
 - Results of previous reviews, assurance, and uncertainty analyses.

48 It is in the interests of the company to retain evidence used in calculating their Scope 3 emissions,
49 whether relating to their own operations or those of others in their supply chain, for inspection by the
50 assurance providers. Companies should ensure they obtain and retain sufficient evidence to support the
51 accuracy of data and reasonableness of assumptions, judgments and estimations.

52

53

54 Automated processes

1 Life cycle assessment software may be used as a secondary data source in supply chain GHG inventory
2 calculations. Depending on inherent risk and the level of assurance sought, assurance providers may
3 deem it appropriate to perform some procedures on the LCA software itself. Indeed, this may be the most
4 efficient way of obtaining sufficient comfort for the level of assurance sought.

5
6 In addition to procedures over the data analysis tools within the system, an assurance provider may
7 perform procedures over the existence and operating effectiveness of system controls such as:

- 8
- 9 • Access controls: The system should be password protected and allow users to have different
10 levels of access depending on their role.
 - 11 • Segregation of duties: In a strong control environment, the system can be used to ensure
12 segregation of duties is maintained.
 - 13 • User log and edit tracking: The system should record when data changes have been made and
14 by whom.
 - 15 • Data protection and back-up: Sufficient controls should be in place over data protection and data
16 back-up.
 - 17 • Change management: any updates (bespoke or otherwise) to the system should be tracked,
18 tested and approved prior to introduction into the live system.
 - 19 • System interfaces: if data is moving between the LCA software and other systems, controls
20 should be in place to validate the completeness and accuracy of the transfer.

22 **12.9 Using the Assurance Findings**

23 Before assurance providers issue their opinion, they can be expected to share their significant findings
24 with the company. This should include any material discrepancies they have identified, both
25 discrepancies that are individually material and those that are material when considered in aggregate.
26 This provides an opportunity to adjust the GHG inventory to eliminate the material discrepancies. If the
27 assurance providers and the company cannot come to an agreement regarding adjustments, then an
28 unqualified ("clean") assurance opinion may not be appropriate. In these circumstances a qualified
29 opinion, expressing the nature of the material discrepancy may be issued.

30 As well as issuing an assurance opinion the assurance providers may, depending on the terms of their
31 engagement, also issue a report to management containing recommendations for future improvements,
32 e.g. where their measurement methodologies can be refined and/or their procedures and controls relating
33 to the measurement methodologies can be improved. The process of assurance can therefore be viewed
34 as a valuable input to the process of continual improvement in GHG emission measurement and
35 reduction. Whether assurance is undertaken for the purposes of internal review, public reporting or to
36 certify conformance with a particular GHG inventory program, it will likely contain useful information and
37 guidance on how to improve and enhance a company's GHG inventory accounting and reporting system.

38 Similar to the process of selecting an assurance provider, those selected to be responsible for assessing
39 and implementing responses to the assurance findings should also have the appropriate skills and
40 understanding of GHG inventory accounting and reporting issues.

1

2 **13 Reporting and Communication**

3 Companies shall report all relevant scope 3 emissions, following the requirements in this standard, in
4 addition to reporting all scope 1 and 2 emissions according to the *GHG Protocol Corporate Standard*.
5

6 **13.1 Required information**

7 A public GHG emissions report that is in accordance with the *GHG Protocol Scope 3 Standard* shall
8 include the following information:
9

- 10
- 11 • A description of the company and inventory boundary, including an outline of the organizational
12 boundaries chosen and the chosen consolidation approach
 - 13 • The reporting period covered
 - 14 • Total scope 1 emissions, total scope 2 emissions, and all required scope 3 emissions, separately
15 reported for each scope
 - 16 • Emissions data for all six GHGs (CO₂, CH₄, N₂O, HFCs, PFCs, SF₆), separately in metric tonnes and
17 in tonnes of CO₂ equivalent
 - 18 • Scope 3 emissions reported separately for each scope 3 category included in the inventory
 - 19 • Methodologies used to calculate or measure emissions
 - 20 • A description of the uncertainties of reported emissions data
 - 21 • A list of scope 3 activities included in the report
 - 22 • A description of the screening assessment approaches used and a description of their associated
23 uncertainties
 - 24 • A list of excluded scope 3 emission sources with justification of their exclusion
 - 25 • Emissions data reported separately for activities calculated using primary data and activities
26 calculated using secondary data, extrapolated data and proxy data
 - 27 • A summary of data types used to calculate the inventory (e.g., the percentages of total scope 3
28 emissions calculated using primary data, secondary data, and extrapolated/ proxy data)

29 **13.2 Optional information**

30 A public GHG emissions report should include, when applicable, the following additional information:
31

- 32
- 33 • Emissions data further disaggregated within scope 3 categories where this adds relevance and
34 transparency (e.g., reporting by different categories of purchased materials or product types)
 - 35 • Qualitative information about emission sources not quantified
 - 36 • Additional qualitative explanations to provide context to the data
 - 37 • The percentage of total anticipated scope 3 emissions that has been accounted for and reported
 - 38 • Information on performance metrics and intensity ratios
 - 39 • Information on the company's GHG management and reduction activities, including supplier
40 engagement metrics, product GHG reduction initiatives, product efficiency metrics, etc.
 - 41 • Information on avoided emissions from the use of sold products
 - 42 • Information on purchases of GHG reduction instruments, such as emissions allowances, offsets, etc.

1

2 **13.2.1 Optional information on partner engagement and performance**

3
4 Because scope 3 emissions are the scope 1 and 2 emissions of a company's partners in the value chain
5 (including suppliers, customers, service providers, etc.), reporting on a company's efforts to engage their
6 partners in the value chain provides additional transparency on a company's scope 3 management and
7 reduction activities.

8 A public GHG emissions report should include, when applicable, the following additional information:

- 9
10 • Partner engagement metrics, such as the number and percentage of suppliers and other partners
11 that have:
12 ○ Received a request from the reporting company to provide primary GHG emissions data;
13 ○ Provided primary GHG emissions data to the reporting company;
14 ○ Publicly reported entity-wide GHG emissions;
15 ○ Established a publicly available entity-wide GHG reduction target;
16
17 • The percentage of value chain emissions for which suppliers and partners have provided GHG data;
18
19 • Partner GHG emissions data, both in absolute terms and allocated to the reporting company on the
20 basis of an established metric (companies shall disclose the allocation metric and methodology
21 used); and
22
23 • Partner performance metrics, including the GHG emissions performance of suppliers and other
24 partners over time.

25 **13.2.1 Optional information on product performance**

26 A public GHG emissions report should include, when applicable, the following additional information:

- 27
28 • Information on the GHG emissions and energy efficiency of a company's product portfolio
29
30 • Product performance metrics and intensity ratios such as the fuel efficiency of sold vehicles, the
31 energy efficiency of sold appliances and electronics, the GHG intensity of sold fuels, etc.
32
33 • The percentage of sold products that are compliant with energy efficiency standards, regulations,
34 and certifications, where applicable

35 **13.3 Uncertainty in scope 3 reporting**

36 Uncertainty is expected to be higher for scope 3 emissions than for scope 1 and 2 emissions. Scope 3
37 emissions are by definition emissions from sources not under the ownership or control of the reporting
38 entity. Data quality, degree of influence over data collection, and level of assurance are likely to be lower
39 for scope 3 sources than for sources under the company's ownership or control. Scope 3 accounting
40 poses additional challenges beyond scope 1 and 2 emissions including accounting for dynamic supply
41 chains, allocating supplier emissions to customers, and broader use of secondary and modeled data. As
42 a result, uncertainty is an inherent aspect of scope 3 reporting.

43 Companies shall describe the level of uncertainty of reported data to ensure transparency and avoid
44 misinterpretation of data.

45 In cases where data uncertainty is high, companies should use improved methods for data collection and
46 calculation to reduce uncertainty.

47 To the extent possible, companies should report emissions data in units of CO₂-e for all categories
48 determined to be relevant, even when uncertainty of data is high. However, it is acknowledged that in
49 some cases companies will have difficulty accessing data or may otherwise have limited confidence in
50 emissions data. In such cases where data uncertainty is exceedingly high, companies may provide an
51 alternative assessment of emissions for a category in place of emissions data in units of CO₂-e, such as
52 semi-quantitative or qualitative information. Examples may include information on the relative magnitude
53 of various scope 3 activities in relation to other scope 1, 2, and 3 sources. Companies shall not exclude
54
55
56

DRAFT FOR ROAD TESTING - JANUARY 2010

1 relevant emissions categories from the reported inventory on the basis of uncertainty.

Part 2: Guidance for Specific Scope 3 Categories

Part 2 of this standard provides specific guidance for each scope 3 category, including:

- A description of each category and a list of activities included in each category
- Guidance for determining which emissions to report
- Guidance on how to calculate emissions
- Case studies and examples

Upstream Emissions

Upstream emissions are the emissions that occur in the life cycle of inputs (i.e., purchased or acquired goods, services, materials, and fuels), up through receipt by the reporting company. These include the scope 1, 2 and 3 emissions of a company's suppliers.

Upstream emissions are categorized into the following categories:

1. Purchased goods and services – Direct (Tier 1) supplier emissions
2. Purchased goods and services – Cradle-to-gate emissions
3. Energy-related activities not included in scope 2
4. Capital equipment
5. Transportation & distribution (upstream)
6. Business travel
7. Waste generated in operations
8. Franchises not included in scope 1 and 2 (upstream)
9. Leased assets not included in scope 1 and 2 (upstream)
10. Investments not included in scope 1 and 2

Categories 3 through 9 represent emissions from specific categories of purchased products, while Categories 1 and 2 include emissions from all other purchased materials and services.

1. Purchased Goods and Services – Direct (Tier 1) Supplier Emissions

1.1 Description

Direct (tier 1) suppliers are companies with which the reporting company has a purchase order for raw materials, components, goods, services, or manufacturing related to the production of product or services sold by the reporting company.

Emissions from this category are limited to the scope 1 and 2 emissions of a reporting company's direct (tier 1) suppliers. Emissions from this category reflect the operational performance of a reporting company's suppliers, rather than the full cradle-to-gate emissions of the materials and services the reporting company purchases, which are accounted for in category 2 below.

This category includes outsourced activities including:

- Contract manufacturing
- Data centers
- Other outsourced services

1.2 Determining Relevant Emissions

Companies should seek to obtain GHG emissions data from all direct suppliers. However, it is acknowledged that many small suppliers will compromise only a small share of a company's total emissions related to its direct suppliers.

Companies should prioritize suppliers based on either their expected contribution to total emissions or to a company's total spend.

Note: The screening methods for Category 1 (Purchased Goods and Services - Direct Supplier Emissions) and Category 2 (Purchased Goods and Services – Cradle to Gate Emissions) are the same and should result in the selection of the same set of purchased goods and services and their suppliers for inclusion in the inventory. For this set of purchased goods and services, Category 1 includes the scope 1 and scope 2 emissions of the direct suppliers of those products, while Category 2 includes the cradle-to-gate emissions of those purchased products.

1.2.1 Emissions-based screening assessment

Under this approach, companies should account for the emissions of those direct suppliers that contribute most to GHG emissions, e.g. by supplying the reporting company with materials and services that are relatively GHG-intense.

To identify relevant suppliers, companies should follow one or more of the following approaches:

- Include suppliers of the highest emitting materials based on the following calculations:
 - Total quantity of materials purchased (tonne) x average emission factor per material (kg CO₂-e/tonne) using secondary process LCA data by material type
 - Total expenditure by material type (dollars) x average emission factor per material type (kg CO₂-e/dollar) using input-output databases
- Include suppliers of all materials that are included in an industry checklist of high-emitting materials
- Include suppliers from sectors that are included in an industry checklist of high-emitting sectors based on input-output databases.

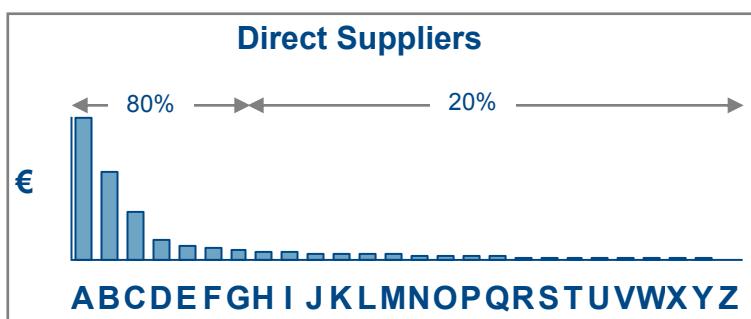

1.2.2 Financial-based screening assessment

Under this approach, companies should account for the emissions of those direct suppliers that represent the majority of the reporting company's total spend.

To identify relevant suppliers, companies should rank their direct suppliers according to their contribution to the reporting company's total spend (i.e., expenditure on each supplier as a percentage of total expenditures).

Companies should include all direct suppliers that collectively account for 80% of the reporting company's total spend, as well as any supplier in the remaining 20% that is individually more than 1% of total spend.

1
2 **Figure XX. Ranking a Company's Direct Suppliers According to Spend**
3

4
5 **Note:** A-Z represent individual suppliers. In this example, suppliers A through G collectively account for
6 80% of the company's spend.
7

8 Companies shall disclose the percentage of emissions from direct suppliers accounted for, calculated as
9 a fraction of total spend (e.g., the company reports emissions from the largest direct suppliers that
10 collectively account for 80% of the reporting company's total spend).
11

12 **1.3 Calculating Emissions**

13 Companies should obtain product-level emissions data from its suppliers following the GHG Protocol
14 *Product Life Cycle Standard* where possible. Otherwise, companies should allocate its suppliers'
15 emissions to its purchased products based on mass, volume, units of production, revenue, etc. (see
16 Chapter 7 for more information).
17

18 To allocate supplier emissions to a customer on the basis of revenue, multiply the supplier's emissions by
19 the percentage of the reporting company's dollar volume to the suppliers' total revenue.
20

21 **Example 1.1: Allocating on the Basis of Revenue**

22 Supplier X emits 1,000 tonnes CO₂e and has revenue of \$5 billion. The reporting company purchases \$1
23 billion worth of goods from Supplier X. The reporting company's scope 3 emissions associated with
24 Supplier X = 1,000 tonnes CO₂e x 1/5 = 200 tonnes CO₂e.
25

26 **1.4 Case Studies**

27 **Box 1.1: Outsourced Activities**

28 Outsourced activities may include contract manufacturing, data centers, logistics, overhead/administrative
29 functions such as human resources and finance/accounting, etc.
30

31 **Contract Manufacturing**

32 Contract manufacturing is a type of outsourcing with a significant GHG impact. Many companies have
33 become "brand stewards" that own and market a product using their well known brand, but outsource
34 manufacturing to other companies rather than manufacture the product themselves. Since contract
35 manufacturing is expected to be large source of emissions, contract manufacturing should be accounted
36 for in a company's scope 3 inventory.
37

38 **Accounting Issues: Tracking Emissions over Time**

1 Following the GHG Protocol *Corporate Standard*, companies shall recalculate base year emissions when
2 structural changes in the reporting organization have a significant impact on the company's base year
3 emissions. A structural change involves the transfer of ownership or control of emissions-generating
4 activities or operations from one company to another. Structural changes include outsourcing and
5 insourcing of emitting activities.

6
7 Outsourcing/insourcing that shifts significant emissions between scope 1 and scope 3 when scope 3 is
8 *not* reported triggers a base year emissions recalculation. However, structural changes due to
9 outsourcing or insourcing do not trigger base year emissions recalculation if the company is reporting its
10 scope 3 emissions from outsourced or insourced activities.

11
12 In case a company decides to track emissions over time separately for different scopes, and has separate
13 base years for each scope, base year emissions recalculation for outsourcing or insourcing is made.

14
Example:

15
16 In Year 1, an auto parts company operates a manufacturing plant with significant GHG emissions. In
17 Year 2 the company shut s down the plant and outsources the manufacturing to three different companies
18 around the world – Companies B, C and D.

19
20 Because Company A outsources its manufacturing to Company's B, C and D, Company A's scope 1 and
21 2 emissions decrease from Year 1 to Year 2. Company A's scope 3 emissions from contract
22 manufacturing increase from Year 1 to Year 2.

23
24 Company A's total scope 1 + scope 2 + scope 3 emissions (including the emissions from contract
25 manufacturing) may increase or decrease from Year 1 to Year 2, depending on whether Company B's,
26 C's and D's operations are more or less GHG-intense than Company A's operations (e.g. depending on
27 the type, age, and efficiency of the companies' manufacturing equipment).

28
29 Year 1 is Company A's base year. Since Company A reports emissions from outsourced activities in both
30 Year 1 and Year 2, Company A does not recalculate its base year emissions.

31
IT and Data Centers

32
33 Data centers are a significant source of GHG emissions, since data centers consume significant amounts
34 of electricity. Microsoft has estimated that in 2006, U.S. data centers alone consumed 61 billion kWh, or
35 about 1.5% of the total electricity consumed in the U.S. that year. On a daily basis, McKinsey estimated
36 that in 2006 the average data center facility consumed the same amount of energy as 25,000
37 households. On a worldwide basis, computer servers were estimated to account for 0.5% of all electricity
38 consumption.

39
40 Substantial electricity is consumed in both operating and cooling computer servers. Several factors affect
41 electricity consumption and GHG emissions, including data center architecture and layout, load
42 balancing, number of data center locations used, and geographic location.

43
Accounting Issues: Calculating Emissions from Shared Facilities

44
45 Most outsourced data centers are shared facilities. The customer outsourcing its data center activities
46 may not have visibility into the data centers' electricity charges. Sometimes, the customer is separately
47 charged for electrical usage on a pass through basis. Often, though, it is included in the service charge,
48 and two customers can have the same electricity consumption and pay materially different charges
49 because of the complexity of the service provided. The actual costs are made more opaque by the fact
50 that outsourcing providers usually smooth the monthly charges over the term of the agreement, so what is
51 paid in year one is the same as what is paid in year 5. Unless the customer focuses on energy
52 consumption in its negotiations, reductions in electricity consumption (and attendant GHG emissions) are
53 unlikely to be reflected in the price it pays for the service.

1 Additionally, the architecture of data center services is moving toward "cloud computing" -- where the data
2 is processed on servers located around the world, and it is not clear whose data is being processed on
3 what server at any given time; rather, the data load of all of the servers is balanced and allocated across
4 the cloud to keep any one set of servers from reaching capacity.
5

6
7 Using financial based accounting in outsourcing as a proxy for electricity consumption/GHG emission is
8 likely to distort the actual emission picture. If a data center operator were to disclose its total electricity
9 consumption for a facility, and the customer knew what percentage of total servers it accounted for, it
10 could estimate the portion of electrical consumption its outsourced activities were responsible for.
11 However, because (i) load balancing, rack configuration, and cloud computing have a material effect on
12 consumption/emission and (ii) data center electricity consumption is such a significant emission source,
13 multiplying the percentage of servers at the facility by total electrical consumption is likely to produce an
14 unreliable proxy for actual emissions from the outsourced activity.
15

16 Other Outsourced Activities 17

18 Other business processes that may be outsourced include finance and accounting, human resources,
19 corporate real estate, etc. These outsourced activities are generally less GHG-intensive than contract
20 manufacturing and data centers, but may shift employee commuting and business travel patterns.
21 Emissions from these outsourced activities should be accounted for where significant.
22

24 2. Purchased Goods and Services – Cradle-to-Gate Emissions 25

26 2.1 Description 27

28 Emissions from purchased goods and services are the GHG emissions associated with extracting and
29 producing materials and services that serve as inputs to a company's operations, including purchased or
30 acquired goods, services, materials and fuels. This category includes the cradle-to-gate emissions of
31 purchased materials prior to acquisition by the reporting company. Purchased products include both
32 goods (e.g., raw materials) and services.
33

34 This category includes all purchased goods and services not otherwise included in the other categories of
35 upstream scope 3 emissions. Specific categories of upstream emissions (e.g., capital equipment,
36 business travel, transportation and distribution, etc.) are separately accounted and reported to enhance
37 the transparency and consistency of reported scope 3 inventories. This general category of purchased
38 goods and services includes all other raw materials, goods and services used as inputs to the company's
39 operations.
40

41 A reporting company's scope 3 emissions from purchased materials are the scope 1, 2 and 3 emissions
42 of its suppliers, including both its direct suppliers (tier 1) and its suppliers' suppliers (tiers 2-X).²³
43

44 2.2 Determining relevant emissions 45

46 Emissions from purchased materials and services are expected to be a relevant scope 3 category for
47 many companies, since emissions from the production of purchased materials are likely to be large
48 compared to other scope 3 activities. Within the category, companies shall identify which categories of
49 purchased materials and services are most relevant for the company and should be reported.
50

51 Companies shall report all relevant cradle-to-gate emissions from purchased materials and services,
52 taking into account not only the emissions of a company's direct suppliers (tier 1), but also the emissions
53 of a company's suppliers' suppliers (tier 2) and beyond (tier 3 - N), where relevant.

²³ Including suppliers of imported electricity, heat, steam and cooling.

Relevant upstream emissions include all emissions in the supply chain where a screening assessment has determined them to be significant in size.²⁴ Companies should conduct a screening assessment to prioritize categories of purchased materials based on size.

To determine which emissions from purchased goods and services are most significant in size, companies should follow these steps:

1. Use screening methods to individually estimate the emissions from all categories of purchased goods and services.
2. Express the estimated emissions from each category of purchased good or service as a fraction of total anticipated scope 3 emissions.
3. Rank all categories of purchased goods and services from largest to smallest to determine which activities are most significant.

Companies shall account for and report emissions from the largest categories of purchased goods and services such that the reporting company accounts for at least 80% of total anticipated scope 3 emissions.²⁵

Companies may use either:

- An emissions-based screening assessment, using emission factors from databases such as secondary (industry-average) life cycle inventory databases or environmentally-extended input-output models, or
- A financial-based screening assessment, using purchase spend.

Companies should give preference to an emissions-based screening assessment over a financial-based screening assessment, since an emissions-based approach more closely approximates actual emissions. While a financial-based approach prioritizes categories of purchased products based on financial activity data alone, an emissions-based approach combines activity data (either financial data such as purchase spend or physical data such as tonnes of materials consumed) with emission factors representing the GHG intensity of different categories of purchased products.

Through the screening assessment, a company should rank each category of purchased materials according to its contribution to either total anticipated emissions or total spend (see Figure XX).

Companies shall disclose:

- The percent of total anticipated emissions from purchased products chosen for inclusion in the boundary;
- The screening assessment approach that was followed; and
- The uncertainties associated with the screening assessment used.

Note: The screening methods for Category 1 (Purchased Goods and Services - Direct Supplier Emissions) and Category 2 (Purchased Goods and Services – Cradle to Gate Emissions) are the same and should result in the selection of the same set of purchased goods and services and their suppliers for inclusion in the inventory. For this set of purchased goods and services, Category 1 includes the scope 1 and scope 2 emissions of the direct suppliers of those products, while Category 2 includes the cradle-to-gate emissions of those purchased products.

²⁴ Relevant upstream emissions should also include other emissions that meet additional relevance criteria outlined in section 5.3.

²⁵ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1
2 **2.2.1 Emissions-based screening assessment**

3
4 Under this approach, companies should account for the emissions of those purchased goods and
5 services that contribute most to GHG emissions. Companies should take into account both the relative
6 quantity purchased as a share of total expenditures (i.e., account for purchased products that represent
7 a large share of total spend) as well as the relative GHG intensity of various categories of purchased
8 products (i.e., account for purchased products that are the most GHG intense).

9
10 To identify relevant categories of purchased goods and services, companies should follow one or more
11 of the following approaches:

- 12
13 • Include the highest emitting purchased goods and services based on the following calculations:
14
15 • Total quantity of materials purchased (tonne) x average emission factor per material (kg
16 CO₂e/tonne) using secondary process LCA data by material type
17 • Total expenditure by material type (dollars) x average emission factor per material type (kg
18 CO₂e/dollar) using input-output databases
19
20 • Include all materials that are included in an industry checklist of high-emitting materials
21
22 • Include all materials from sectors that are included in an industry checklist of high-emitting
23 sectors based on input-output databases.

24
25 **2.2.2 Financial-based screening assessment**

26
27 Under this approach, companies should account for the emissions of those categories of purchased
28 goods and services that represent the majority of the reporting company's total spend.

29
30 To identify relevant purchased goods and services, companies should rank their categories of
31 purchased goods and services in the reporting year according to their contribution to the reporting
32 company's total spend (i.e., expenditure on each category as a percentage of total expenditures). See
33 Figure XX.

34
35 Companies should include all purchased goods and services that collectively account for at least 80% of
36 the reporting company's total spend, as well as any category in the remaining 20% that is individually
37 more than 1% of total spend. Companies should also account for any additional categories that are
38 expected to contribute significantly to emissions, such as small areas of spend that have relatively high
39 emissions.

40
41 Companies shall disclose the percentage of emissions from purchased goods and services accounted
42 for, calculated as a fraction of total spend (e.g., the company reports emissions from the largest
43 categories of purchased goods and services that collectively account for 80% of the reporting company's
44 total spend).

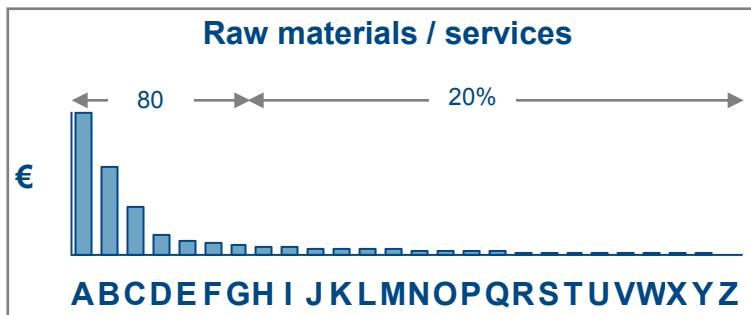

45
46 **Box 2.1: Alternate Boundary Requirements if Using a Financial-Based Screening Assessment**

47
48 Using a financial-based screening method does not allow a company to estimate total anticipated
49 emissions from purchased goods and services. Therefore, the requirement to account for and report at
50 least 80% of total anticipated scope 3 emissions is not compatible with the use of financial-based
51 screening methods.

52
53 If a company uses a financial-based screening method for Category 2 (Purchased Goods and Services –
54 Cradle to Gate Emissions), then the company shall account for and report:

- For Category 2 (Purchased Goods and Services – Cradle to Gate Emissions); Emissions from the largest 80% of categories of purchased goods and services based on spend;
- For Categories 3-13, 15, and 16: At least 80% of total anticipated emissions from the sum of Categories 3-13, 15, and 16;
- For Category 14 (Use of Sold Products): The use phase emissions of: all sold products that consume energy (fossil fuels or electricity) in the use phase; all sold fuels; and all sold products that contain and emit GHGs in the use phase (see Part 2, Section 14 for more information); and
- All scope 1 and scope 2 emissions, as required by the GHG Protocol *Corporate Standard*.

Figure 2.1. Ranking a Company's Purchased Product Categories According to Spend

Note: A-Z represent individual categories of purchased products. In this example, categories A through G collectively account for 80% of the company's spend.

2.3 Calculating emissions

Once the relevant categories of purchased products have been identified, the next step is to collect GHG data for each product category. Companies should collect data according to the following order of preference:

- Primary data from a company's direct suppliers
- Secondary data (industry-average) data from published sources, such as life cycle inventory or input-output databases
- Other types of estimated data

Companies should give preference to primary data collection to enable performance tracking of company- and product-specific improvements and to engage suppliers to expand GHG management throughout the supply chain. Companies may use secondary and estimated data when primary data is not available or not representative.

For each category of purchased product, companies should determine whether primary data or secondary data is expected to yield a more representative estimate of cradle-to-gate GHG impact. To do so, companies should divide purchased materials into two categories:

1. **Purchased materials where the most significant cradle-to-gate emissions are the scope 1 and 2 emissions of the reporting company's tier 1 supplier.** For these materials, companies should obtain primary (company-specific) data from its tier 1 suppliers, including scope 1, scope 2, and if available, scope 3 emissions.²⁶

²⁶ Companies should obtain product-level emissions data from its suppliers following the GHG Protocol Product Life Cycle Standard if possible. Otherwise, companies should allocate its suppliers' emissions to its purchased products based on mass, volume, revenue, etc.

- 1 2. Purchased materials where the most significant cradle-to-gate emissions occur further
 2 upstream than the reporting company's tier 1 supplier (i.e., the scope 1 and 2 emissions of
 3 the reporting company's tier 2-N suppliers). For these materials, companies may collect
 4 primary data from their tier 2-N suppliers or estimate emissions using secondary (industry
 5 average) emission factors (e.g., life cycle inventory data). Companies should estimate the full
 6 upstream (cradle to gate) emissions of the purchased products.

7
 8 Emissions calculated using primary data shall be reported separately from emissions calculated using
 9 secondary and estimated data.

10 Companies shall disclose the calculation methodologies and assumptions used to estimate emissions.

11
 12 **Figure 2.2:** Choosing data types for various categories of purchased products

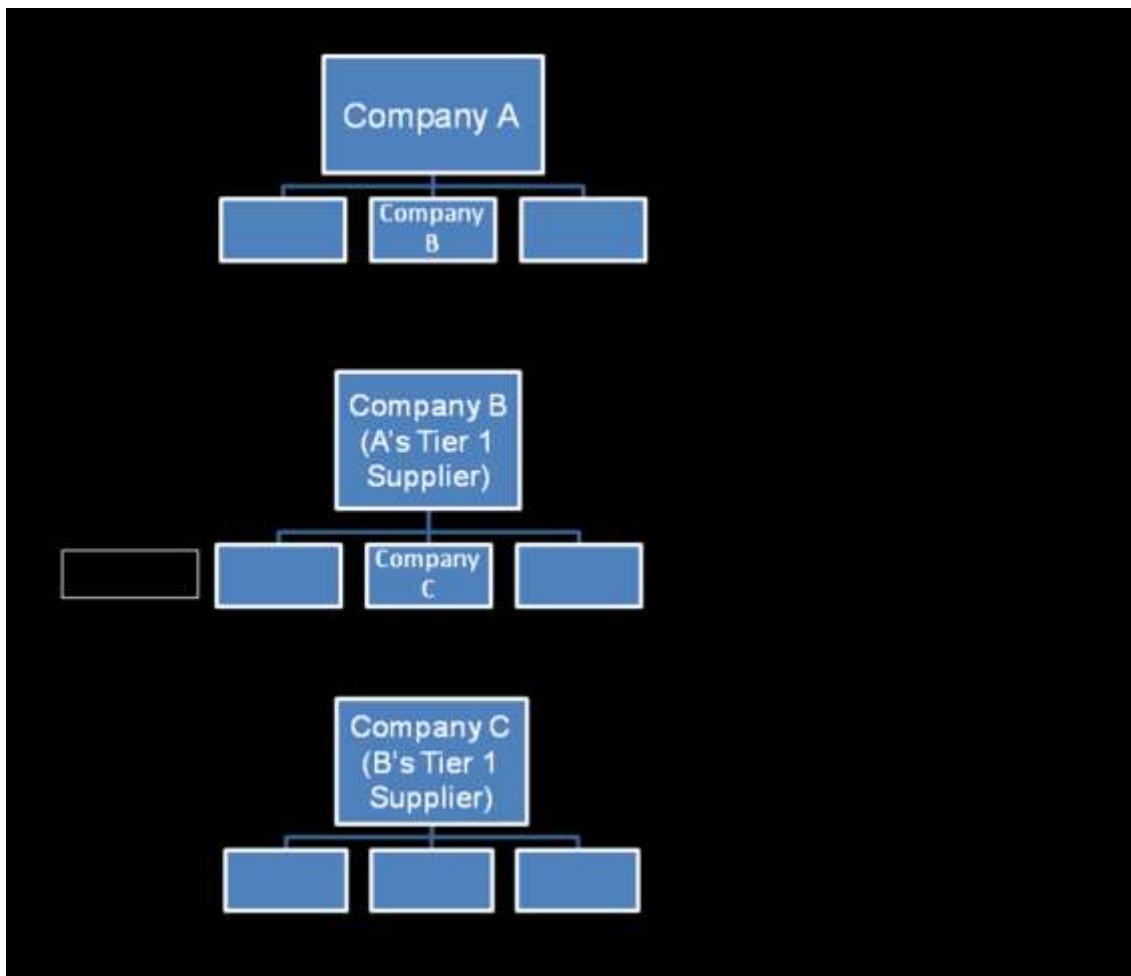

13
 14

	Spend Category	A	B	C	D	E	F
Preference ↑	Primary Data	X	X	X			
	Secondary Data			X	X	X	
	Estimated Data					X	X

15
 16 **2.3.1 Calculating emissions from purchased products using supplier-specific (primary) data**

17
 18
 19

1
2 **Figure 2.3:** Propagation of primary data collection throughout a supply chain
3

4
5
6 Note: Companies should obtain product-level emissions data from its suppliers following the GHG
7 Protocol *Product Life Cycle Standard* where possible. Otherwise, companies should allocate its suppliers'
8 emissions to its purchased products based on mass, volume, revenue, etc. (see Chapter 7).
9

10
11 **2.3.2 Calculating emissions from purchased products using secondary data**

12
13 **2.4 Case studies and examples**

14
15 **3. Energy-Related Emissions Not Included in Scope 2**

16
17 **1.1 Description**

18 This category includes:
19

- 20
21 3.1. Extraction, production, and transportation of fuels consumed in the generation of electricity,
22 steam, heating and cooling (either purchased or own generated by the reporting company)
23

- 1 • Note: This category is applicable to end users of electricity. Refer to Section 1.2 below
 2 to determine if relevant and should be reported.

3 3.2. Generation of electricity, steam, heating, and cooling that is consumed in a T&D system
 4 (reported by end user)

- 5 • Note: This category is applicable to end users of electricity. Refer to Section 1.2 below
 6 to determine if relevant and should be reported.

7 3.3. Purchase of electricity, steam, heating, and cooling that is sold to an end user (reported by
 8 utility company or energy retailer).

- 9 • Note: *This category is only applicable to utility companies and energy retailers that*
 10 *purchase energy for resale.* Refer to Section 1.2 below to determine if relevant and
 11 should be reported.

12 **1.2 Determining relevant emissions**

13 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 14 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
 15 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
 16 scope 3 emissions.
 17 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
 18 significant.

19 Companies may use either:

- 20 • An emissions-based screening assessment, or
 21 • A financial-based screening assessment.

22 Companies should give preference to an emissions-based screening assessment over a financial-based
 23 screening assessment, since an emissions-based approach more closely approximates actual emissions.

24 Companies shall account for and report the largest scope 3 sources that collectively account for at least
 25 80% of total anticipated scope 3 emissions.²⁷

26 **3.2.1. Emissions-based screening assessments**

<p>3.1.Extraction, production, and transportation of fuels consumed in the generation of electricity, steam, heating and cooling (either purchased or own generated by the reporting company)</p>	<ul style="list-style-type: none"> Electricity: Total electricity purchase (MWh) x average national or regional Scope 3 emission factor (t CO2-e/MWh) if known, otherwise use default value of [X%] (to be provided) Steam: Total steam purchase (GJ) x average national or regional Scope 3 emission factor (t CO2-e/GJ) if known, otherwise use default value of [X%] (to be provided) Cooling: Total cooling purchase (GJ) x average national or regional Scope 3 emission factor (t CO2-e/GJ) if known, otherwise use default value of [X%] (to be provided) <p><i>Note: The "Scope 3 emission factor" is an emission factor representing total life cycle emissions of each energy</i></p>
---	--

²⁷ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

	<i>type excluding the combustion phase (i.e., life cycle emissions of each energy type upstream of combustion). Emissions from combustion are counted in the grid average emission factor used to calculate scope 2 emissions.</i>
3.2. Generation of electricity, steam, heating, and cooling that is consumed in a T&D system (reported by end user)	<ul style="list-style-type: none"> For each country of operation: Total scope 2 emissions by energy type × national average T&D loss factor (%) by energy type if known, otherwise use default value of [X%] (to be provided)
3.3 Purchase of electricity, steam, heating, and cooling that is sold to an end user (reported by utility company or energy retailer)	<ul style="list-style-type: none"> <u>Conservative method:</u> Total purchased electricity, steam, heating or cooling for resale to end-users (in MWh) * emission factor (kg CO₂-e/MWh) of the highest emitting source purchased <u>Average method:</u> Total purchased electricity, steam, heating or cooling for resale to end-users (in MWh) * mass-weighted grid or national average emission factor (kg CO₂-e/MWh) of all emitting sources purchased

3.2 Generation of electricity, steam, heating, and cooling that is consumed in a T&D system (reported by end user)	<ul style="list-style-type: none"> N/A
3.3 Purchase of electricity, steam, heating, and cooling that is sold to an end user (reported by utility company or energy retailer)	<ul style="list-style-type: none"> Revenues from energy purchased for resale to end-users as a share of your organization's total revenues (%)

4
5
6

3.2.3 Other Criteria for Determining Relevant Emissions

7 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
8 emissions in terms of size,²⁸ companies should consider other criteria to determine whether additional
9 scope 3 activities should be accounted for and reported.

10
11
12
13
14
15
16
17
18
19
20

Scope 3 activities should be considered relevant if they meet any of the following criteria:

- There are potential emissions reductions that could be undertaken or influenced by the company
- They contribute to the company's risk exposure (e.g., climate change related risks such as financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and physical risks)
- They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or civil society)
- They are an outsourced activity that is typically insourced by other companies in the reporting company's sector

²⁸ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1 5. They meet additional criteria developed by the company or industry sector
2

3 **1.3 Calculating emissions**

4 **1.4 Case studies and examples**

7 **4. Capital Equipment**

8 **4.1 Description**

9 Capital equipment refers to equipment that a company uses to manufacture a product, provide a service
10 or sell, store and deliver merchandise. This equipment has an extended life so that it is properly regarded
11 as a fixed asset.

12 This category includes the cradle-to-gate emissions associated with manufacturing or constructing the
13 capital equipment owned or controlled by the reporting company.

14 A reporting company's scope 3 emissions from capital equipment are the scope 1, 2 and 3 emissions of
15 its suppliers of capital equipment.

16 **4.2 Determining relevant emissions**

17 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 18 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
19 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
20 scope 3 emissions.
21 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
22 significant.

23 Companies may use either:

- 24 • An emissions-based screening assessment, or
25 • A financial-based screening assessment.

26 Companies should give preference to an emissions-based screening assessment over a financial-based
27 screening assessment, since an emissions-based approach more closely approximates actual emissions.

28 Companies shall account for and report the largest scope 3 sources that collectively account for at least
29 80% of total anticipated scope 3 emissions.²⁹

30 **4.2.1. Emissions-based screening assessments**

- 31 • Units of equipment x industry average life cycle emission factor per unit of equipment (t CO₂-e)
32 using secondary process LCA data
33 • Quantity of primary material within equipment (tonne) x industry average emission factor by
34 material type (kg CO₂-e /tonne) using secondary process LCA data
35 • Total expenditure by equipment type (dollars) x average emission factor per equipment type
36 (kg CO₂-e/dollar) using input-output databases
37 • Refer to an industry checklist based on input-output databases to determine if capital
38 equipment is expected to be a high priority category (to be provided)

²⁹ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1
2 **4.2.2 Financial-based screening assessments**

- 3
- 4 • Expenditure on capital equipment as a share of total expenditures (%)
 - 5 • Capital equipment as a share of your organization's total financial capital (%)

6
7 **4.2.3 Other Criteria for Determining Relevant Emissions**

8
9 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
10 emissions in terms of size,³⁰ companies should consider other criteria to determine whether additional
11 scope 3 activities should be accounted for and reported.

12 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 13
- 14 1. There are potential emissions reductions that could be undertaken or influenced by the company
 - 15 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
16 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
17 physical risks)
 - 18 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
19 investors or civil society)
 - 20 4. They are an outsourced activity that is typically insourced by other companies in the reporting
21 company's sector
 - 22 5. They meet additional criteria developed by the company or industry sector

23
24 **4.3 Calculating emissions**

25
26 **4.4 Case studies and examples**

27
28 **5. Transportation & Distribution (Upstream / Inbound)**

29
30 **5.1 Description**

31 This category includes the emissions from:

- 32
- 33 5.1 External³¹ transportation & distribution of inputs (i.e., purchased or acquired goods, services,
34 materials or fuels), including intermediate (inter-facility) transport & distribution, associated
35 with direct suppliers (transport/logistics providers);
 - 36 5.2 External warehousing & storage of inputs (i.e., purchased or acquired goods, services,
37 materials or fuels), associated with direct suppliers (transport/logistics providers); and
 - 38 5.3 External transportation of waste generated in operations

39 A reporting company's scope 3 emissions from transportation and distribution are the scope 1 and 2
40 emissions of its logistics providers, dependent on ownership of warehouse and transportation contracts.

41
42 **5.2 Determining relevant emissions**

43 To determine which scope 3 activities are most significant in size, companies should follow these steps:

44

³⁰ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

³¹ i.e., in vehicles and facilities not owned or controlled by the reporting company.

1. Use screening methods to individually estimate the emissions from all scope 3 activities.
2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated scope 3 emissions.
3. Rank all scope 3 activities from largest to smallest to determine which activities are most significant.

Companies may use either:

- An emissions-based screening assessment, or
- A financial-based screening assessment.

Companies should give preference to an emissions-based screening assessment over a financial-based screening assessment, since an emissions-based approach more closely approximates actual emissions.

Companies shall account for and report the largest scope 3 sources that collectively account for at least 80% of total anticipated scope 3 emissions.³²

5.2.1. Emissions-based screening assessments

<p>5.1 External transportation & distribution of inputs (i.e., purchased or acquired goods, services, materials or fuels), including intermediate (inter-facility) transport & distribution, associated with direct suppliers</p>	<ul style="list-style-type: none"> • For each transportation mode (i.e., air, rail, truck, barge): Estimated total distance travelled (km) x total quantity transported (tonnes) x industry average emission factor (kg CO₂-e/tonne-km)
<p>5.2 External warehousing & storage of inputs (i.e., purchased or acquired goods, services, materials or fuels), associated with direct suppliers</p>	<ul style="list-style-type: none"> • Number of third party warehouses used to store products inbound to your company x conservative estimated storage space per warehouse (m³) x industry average emission factor (kg CO₂-e/m³)
<p>5.3 External transportation of waste generated in operations</p>	<ul style="list-style-type: none"> • Waste generated (tonnes) x conservative estimated distance to landfill (km) x average emission factor (kg CO₂-e/tonne-km for trucks)

5.2.2 Financial-based screening assessments

³² Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

5.1 External transportation & distribution of inputs (i.e., purchased or acquired goods, services, materials or fuels), including intermediate (inter-facility) transport & distribution, associated with direct suppliers	<ul style="list-style-type: none"> Expenditure on external transportation and logistics as a share of total expenditures (%)
5.2 External warehousing & storage of inputs (i.e., purchased or acquired goods, services, materials or fuels), associated with direct suppliers	<ul style="list-style-type: none"> Expenditure on external warehousing and storage as a share of total expenditures (%)
5.3 External transportation of waste generated in operations	<ul style="list-style-type: none"> Expenditure on transportation of waste as a share of total expenditures (%)

1 **5.2.3 Other Criteria for Determining Relevant Emissions**

2 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
3 emissions in terms of size,³³ companies should consider other criteria to determine whether additional
4 scope 3 activities should be accounted for and reported.

5 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 1 There are potential emissions reductions that could be undertaken or influenced by the company
- 2 They contribute to the company's risk exposure (e.g., climate change related risks such as financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and physical risks)
- 3 They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or civil society)
- 4 They are an outsourced activity that is typically insourced by other companies in the reporting company's sector
- 5 They meet additional criteria developed by the company or industry sector

6 **5.3 Calculating emissions**

7 This guidance is intended to facilitate corporate-level measurement and reporting of greenhouse gases (GHG) emissions from freight transportation and distribution. The section addresses Scope 3 emissions from the use of transportation sources that are owned or controlled by other entities. The following categories of sources are covered:

- 8 • Road transport
- 9 • Rail transport

³³ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 1 • Air transport
- 2 • Water transport
- 3 • Terminal handling
- 4 • Storage (warehousing)

5 This is a cross-sectoral guideline which shall be used by all industry and service sectors whose
6 operations involve freight transportation and/or distribution.

7

8 **5.3.1 Calculation methodology**

9 Once the transportation and distribution supply chain has been mapped companies have to define the
10 appropriate calculation methodology for the freight transportation activities.

11 1. Fuel-based methodology: fuel consumption is multiplied by the CO₂ emission factor for each fuel type

$$13 \quad \text{CO}_2 \text{ Emissions} = \text{Fuel Used} \times \text{Heating Value} \times \text{Emission factor}$$

14 2. Distance-based methodology to calculate CO₂ emissions: emissions can be calculated by using
15 distanced based emission factors (e.g. g/km) to calculate emissions

$$17 \quad \text{CO}_2 \text{ Emissions} = \text{Distance Travelled} \times \text{Emission factor}$$

18 3. Activity-based methodology to calculate CO₂ emissions: emissions can be calculated by using cargo
19 transport activity based emission factors (e.g. g/t-km) to calculate emissions

$$20 \quad \text{CO}_2 \text{ Emissions} = \text{Quantity} \times \text{Distance Travelled} \times \text{Emission factor}$$

21

22 For those activities that do not depend on the distance travelled (storage, terminal operations) the fuel-
23 based methodology can be substituted by a methodology based on specific emission factors for these
24 activities.

25

26 **5.3.1.1 Fuel-based methodology**

27 The fuel-based methodology has a higher degree of accuracy than the distance-based methodology.
28 When using this methodology companies shall need from their providers not only data related to the total
29 consumption in that leg by the vehicle but also about how much of that consumption corresponds to the
30 freight that belongs to the company and what allocation key has been used to calculate that.

31

32 **5.3.1.2 Distance-based and activity-based methodology**

33 Emissions from the distance-based methodology can be collected from each specific carrier or mode
34 operator, from carrier associations or from LCA databases. The factor used conditions the accuracy of the
35 final result. Factors can be classified in:

- 36 • Primary – high accuracy: specific emissions from a particular shipment provided by the carrier. In
37 that case the carrier does not provide a factor but the total emissions associated to that shipment.
- 38 • Primary – medium accuracy: emission factors per trade-line provided by the carrier. These are
39 based on network configuration (vehicle mix) and historical emission factors per type of vehicle.
- 40 • Primary – low accuracy: global average emission factor provided by the carrier or an association
41 of carriers
- 42 • Secondary: LCA databases or general average emission factors

43 A description of emission factors is provided in Table A

1

2 **5.3.2 Mapping**

3 For transportation activities the first step to estimate the scope 3 emissions is to map the supply chain in
4 terms of:

- 5 • Modes of transportation and vehicles utilized for each mode
- 6 • Quantities for each shipment
- 7 • Distances for each shipment
- 8 • Vehicle utilizations if necessary
- 9 • Inter-modal changes (e.g. sea terminal)
- 10 • Storage points (including days of storage)
- 11 • Refrigerated activities

12

13 **5.3.2.1 Quantities for each shipment**

14 Companies should convert the quantities for each transportation leg should into the unit that drives fuel
15 consumption in that specific transportation mode (e.g. containers for containerships tonnes for road and
16 air freight etc.). Assumptions for the conversion factors should be noted down in case the standard
17 conversion factors (see Table A) are not used.

18

19 **5.3.2.2 Distances for each shipment**

20 When using the distance-based methodology companies should use actual distances to be provided by
21 transportation suppliers. In case these are not available companies should use available software to
22 calculate direct distances for each leg of the transportation supply chain.

23 For airfreight transportation 200km should be added to the direct distance to account for the extra
24 distance related to landing and take-off operations.

25

26 **5.3.2.3 Utilizations**

27 The amount of backhaul emissions that should be associated to the main hauls depends of several
28 factors that companies should consider when estimating their scope 3 transportation and distribution
29 calculations.

30 The utilization used in the calculations shall consider (in that order and when available)

- 31 • Exact utilization for the specific shipment in the backhaul; or
- 32 • Average utilization in that route's backhaul
- 33 • Average utilization for the backhauls in that transportation leg (industry average)

34 Note that many emission factors provided by transportation associations and LCA databases include
35 already the utilization factors.

36

37 **5.3.3 Calculation**

38 Once the methodology has been selected and the data has been collected companies shall calculate
39 their emissions from transportation and distribution activities in the following way.

- 40 • Fuel-based methodology: $\text{CO}_2 \text{ Emissions} = \text{Fuel Used} \times \text{Heating Value} \times \text{Emission factor}$
- 41 • Distance-based methodology to calculate CO_2 emissions for transportation

43 $\text{CO}_2 \text{ Emissions} = \text{Distance Travelled (km)} \times \text{Emission factor (g/vkm)} \text{ vkm} = \text{vehicle km}$

- 1 • Activity-based methodology to calculate CO₂ emissions for transportation

2 CO₂ Emissions = Quantity (t) x Distance Travelled (km) x Emission factor (g/t-km)

- 3 • Methodology for storage: CO₂ emissions = storage days x emission factor
4 • Methodology for terminals: CO₂ emissions = unit x emission factor

5 To calculate emissions from transportation, refer to:

- 6 • GHG Protocol Calculation Tool, "Mobile Combustion GHG Emissions Calculation Tool. Version
7 2.0. June 2009" Developed by World Resources Institute, available at <http://www.ghgprotocol.org>.

8 Table 5.1 gives guidance on the calculations for the distance-based methodology.

9

10

11

1 **6. Business Travel**

2 **6.1 Description**

3 Business travel includes transportation to move employees to accomplish business-related activities in
4 vehicles owned or operated by third parties.

5 This category excludes:

- 6 • Vehicles owned and leased by the reporting company, which are accounted under Scope 1 or as
7 leased assets under Scope 3; and
- 8 • Employee commuting, which is accounted under employee commuting.

9 Emissions from business travel include the emissions from the combustion of fuels in vehicles (e.g., the
10 fuel consumed by an aircraft), but not the life cycle emissions associated with manufacturing capital
11 equipment and infrastructure (e.g. the emissions associated with manufacturing the aircraft).

12 Organizations may opt to include emissions from business travelers staying in hotels.

13 A reporting company's scope 3 emissions from business travel are the scope 1 and 2 emissions of
14 airlines; railroads, bus operators; rental car companies; employees reimbursed for organizational travel;
15 hotel operators; etc.

16 **6.2 Determining relevant emissions**

17 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 18 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
- 19 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
20 scope 3 emissions.
- 21 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
22 significant.

23 Companies may use either:

- 24 • An emissions-based screening assessment, or
- 25 • A financial-based screening assessment.

26 Companies should give preference to an emissions-based screening assessment over a financial-based
27 screening assessment, since an emissions-based approach more closely approximates actual emissions.

28 Companies shall account for and report the largest scope 3 sources that collectively account for at least
29 80% of total anticipated scope 3 emissions.³⁴

30 **6.2.1. Emissions-based screening assessments**

- 31 • Estimated total air distance traveled (km) x average emission factor for air travel (kg CO₂-e/passenger-km) + estimated total road distance traveled (km) x average emission factor for road travel (kg CO₂-e/passenger-km) + estimated total rail distance traveled (km) x average emission factor for rail travel (kg CO₂-e/passenger-km)
- 32 • Total expenditure on business travel (dollars) x average emission factor (kg CO₂-e/dollar) using input-output databases

³⁴ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 1 • Refer to an industry checklist based on input-output databases to determine if business travel
2 is expected to be a high priority category (to be provided)

3
4 **6.2.2 Financial-based screening assessments**

- 5
6 • Expenditure on business travel as a share of total expenditures (%)

7
8 **6.2.3 Other Criteria for Determining Relevant Emissions**

9
10 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
11 emissions in terms of size,³⁵ companies should consider other criteria to determine whether additional
12 scope 3 activities should be accounted for and reported.

13 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 14
15 1. There are potential emissions reductions that could be undertaken or influenced by the company
16 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
17 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
18 physical risks)
19 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
20 investors or civil society)
21 4. They are an outsourced activity that is typically insourced by other companies in the reporting
22 company's sector
23 5. They meet additional criteria developed by the company or industry sector

24
25 **6.3 Calculating emissions**

26
27 Calculating emissions from business travel involves multiplying activity data (i.e., person-kilometers
28 travelled by mode of transport) by emission factors (typically default national emission factors by mode of
29 transport). Modes of transport include aircraft, rail, subway, bus, automobile, etc.

30
31 Companies should track total annual distance traveled by transport mode. Methods of data collection
32 include:

- 33
34 • Automatic tracking of distance traveled through a travel agency
35 • Adding distance traveled and mode of transport to travel forms completed by employees (e.g.
36 existing expense reporting forms)

37
38 Companies may extrapolate from a representative sample of employees to represent the total business
39 travel of all employees. The activity data should be summed to obtain total annual person-kilometers
40 traveled by each mode of transport.

41
42 To calculate emissions from business travel, refer to:

- 43
44 • GHG Protocol Calculation Tool, "Mobile Combustion GHG Emissions Calculation Tool. Version
45 2.0. June 2009" Developed by World Resources Institute, available at <http://www.ghgprotocol.org>.
46 • US EPA Climate Leaders GHG Inventory Protocol, "Optional Emissions from Commuting,
47 Business Travel and Product Transport," available at:
48 http://www.epa.gov/stateply/documents/resources/commute_travel_product.pdf

50
51 ³⁵ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of
52 Sold Products)

1 **6.4 Case studies and examples**

2 World Resources Institute: Scope 3 Emissions from Air Travel, 2007

Scope 3 (air travel)	Source of emissions	Activity data	Emission factor	Metric tons of CO₂
	 <i>Air travel, short flights</i>	67,947 km	0.15 kg of CO ₂ /km	10
	 <i>Air travel, medium flights</i>	586,313 km	0.12 kg of CO ₂ /km	70
	 <i>Air travel, long flights</i>	5,608,093 km	0.11 kg of CO ₂ /km	617
Total				697 tCO₂

4 Note: The emission factors in the table above are illustrative only and should not be used to calculate
5 emissions. Refer to the tools referenced above for the most up-to-date emission factors.

7 **7. Waste Generated in Operations**

8 **7.1 Description**

9 This category includes emissions from the transportation, disposal and/or treatment of wastes generated
10 as a result of operations.

11 A reporting company's scope 3 emissions are the scope 1, 2 and 3 emissions of the waste / wastewater
12 management organization.

13 Disposal of wastes (landfilling, combustion) results in potentially significant greenhouse gas emissions.
14 Landfilling of organic wastes results in anaerobic decomposition and methane generation, a greenhouse
15 gas with a higher global warming potential than CO₂. Combustion of fossil based components without
16 energy recovery constitutes disposal and releases fossil based CO₂ emissions. Transportation of wastes
17 from the point of generation to the disposal site also results in greenhouse gas emissions.

18 **7.2 Determining relevant emissions**

19 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 20 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
- 21 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
22 scope 3 emissions.
- 23 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
24 significant.

25 Companies may use either:

- 26 • An emissions-based screening assessment, or
- 27 • A financial-based screening assessment.

Companies should give preference to an emissions-based screening assessment over a financial-based screening assessment, since an emissions-based approach more closely approximates actual emissions.

Companies shall account for and report the largest scope 3 sources that collectively account for at least 80% of total anticipated scope 3 emissions.³⁶

7.2.1. Emissions-based screening assessments

- For solid waste: Mass of waste x Average carbon content of waste (30% default) x average methane content of landfill gas (0.5 default) x 16/12 x CH₄ Global Warming Potential
- For wastewater treatment: Annual wastewater discharged (m³) x Average chemical oxygen demand, COD (kg / m³) x IPCC Default maximum CH₄ producing capacity (0.25 kg CH₄ / kg COD) x CH₄ Global Warming Potential

7.2.2 Financial-based screening assessments

- Expenditure on waste disposal/treatment as a share of total expenditures (%)

7.2.3 Other Criteria for Determining Relevant Emissions

In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3 emissions in terms of size, companies should consider other criteria to determine whether additional scope 3 activities should be accounted for and reported.

Scope 3 activities should be considered relevant if they meet any of the following criteria:

1. There are potential emissions reductions that could be undertaken or influenced by the company
2. They contribute to the company's risk exposure (e.g., climate change related risks such as financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and physical risks)
3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or civil society)
4. They are an outsourced activity that is typically insourced by other companies in the reporting company's sector
5. They meet additional criteria developed by the company or industry sector

7.3 Calculating emissions

7.4 Case studies and examples

³⁶ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1
2 **8. Franchises Not Included in Scope 1 and 2 (Upstream)**
3

4 **8.1 Description**
5

6 This category includes emissions of a franchisor's operations, reported by the franchisee.
7

- 8 • *Note: This category is only applicable to companies that own or operate franchises.*
- 9 • *Note: This category is reported by the franchisor, not the franchisee. (Franchisees should refer
10 to Section 11 of Part 2).*

12 A reporting company's scope 3 emissions from franchises (upstream) are the scope 1, 2 and 3 emissions
13 of the franchisor.
14

15 **8.2 Determining relevant emissions**
16

17 To determine which scope 3 activities are most significant in size, companies should follow these steps:
18

- 19 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
- 20 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
21 scope 3 emissions.
- 22 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
23 significant.

25 Companies may use either:
26

- 27 • An emissions-based screening assessment, or
- 28 • A financial-based screening assessment.

30 Companies should give preference to an emissions-based screening assessment over a financial-based
31 screening assessment, since an emissions-based approach more closely approximates actual emissions.
32

33 Companies shall account for and report the largest scope 3 sources that collectively account for at least
34 80% of total anticipated scope 3 emissions.³⁷
35

36 **8.2.1. Emissions-based screening assessments**
37

- 38 • Total franchisor corporate emissions (tonnes CO₂-e), as reported by the franchisor

40 **8.2.2 Financial-based screening assessments**
41

- 42 • Expenditure on franchise operations as a share of total expenditures (%)

44 **8.2.3 Other Criteria for Determining Relevant Emissions**
45

46 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
47 emissions in terms of size, companies should consider other criteria to determine whether additional
48 scope 3 activities should be accounted for and reported.
49

50 Scope 3 activities should be considered relevant if they meet any of the following criteria:
51

- 52 1. There are potential emissions reductions that could be undertaken or influenced by the company

³⁷ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 2 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
3 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
4 physical risks)
- 5 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
6 investors or civil society)
- 7 4. They are an outsourced activity that is typically insourced by other companies in the reporting
8 company's sector
- 9 5. They meet additional criteria developed by the company or industry sector

10 **8.3 Calculating emissions**

11 **8.4 Case studies and examples**

16 **9. Leased Assets Not Included in Scope 1 and 2 (Upstream)**

18 **9.1 Description**

20 Emissions from the manufacturing, construction, or operation of leased assets not included in the
21 Lessee's Scope 1 or 2 emissions.

- 23 • *Note: This category is only applicable to companies that operate leased assets.*

25 A reporting company's scope 3 emissions from leased assets are the scope 1, 2 and 3 emissions of the
26 owner of the leased asset (i.e, lessor).

28 **9.2 Determining relevant emissions**

30 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 32 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
- 33 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
34 scope 3 emissions.
- 35 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
36 significant.

38 Companies may use either:

- 40 • An emissions-based screening assessment, or
41 • A financial-based screening assessment.

43 Companies should give preference to an emissions-based screening assessment over a financial-based
44 screening assessment, since an emissions-based approach more closely approximates actual emissions.

46 Companies shall account for and report the largest scope 3 sources that collectively account for at least
47 80% of total anticipated scope 3 emissions.³⁸

49 **9.2.1. Emissions-based screening assessments**

- 51 • Conservative method: Number of leased assets x emissions of highest emitting leased asset
52 (tonnes CO₂-e)

³⁸ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- Average method: Number of leased asset x industry average emissions per leased asset (tonnes CO₂-e)
- For commercial assets (office, warehouse, retail) & light manufacturing: floor space (sq m) x published average emission factor (kg CO₂-e/sq m) by building type

9.2.2 Financial-based screening assessments

- Expenditure on leased assets as a share of total expenditures (%)

9.2.3 Other Criteria for Determining Relevant Emissions

In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3 emissions in terms of size,³⁹ companies should consider other criteria to determine whether additional scope 3 activities should be accounted for and reported.

Scope 3 activities should be considered relevant if they meet any of the following criteria:

1. There are potential emissions reductions that could be undertaken or influenced by the company
2. They contribute to the company's risk exposure (e.g., climate change related risks such as financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and physical risks)
3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or civil society)
4. They are an outsourced activity that is typically insourced by other companies in the reporting company's sector
5. They meet additional criteria developed by the company or industry sector

9.3 Calculating emissions

9.4 Case studies and examples

10. Investments Not Included in Scope 1 and 2

10.1 Description

This category includes GHG emissions associated with investments, including fixed asset investments and equity assessment not included in scope 1 and 2. Depending on its selection of a consolidation approach (equity share, operational control or financial control), a company will include and exclude certain equity assets from its corporate boundary. All wholly owned, partially owned, or controlled assets that do not fall into scope 1 or 2 are accounted for as scope 3 emissions, including group companies/subsidiaries, associated/affiliated companies, non-incorporated joint ventures/partnerships/operations where partners have joint financial control, etc.

Fixed asset investments are investments where the reporting company has neither significant influence nor financial control. Fixed asset investments are not accounted under the equity share or financial control approach as scope 1 and 2 emissions, but are accounted as scope 3 emissions.

For more information, see the *GHG Protocol Corporate Standard*, Chapter 3: “Setting Organizational Boundaries.”

³⁹ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1 A reporting company's scope 3 emissions from investments are the scope 1, 2, and 3 emissions of the
2 companies receiving investment.

3
4 Note that this category does not refer to investments in the financial services sector. For companies in the
5 financial sector, investments are accounted for as scope 3 emissions from the use of sold products and
6 services. See Section 13 for more information on scope 3 emissions from the use of sold products.
7

8 **10.2 Determining relevant emissions**
9

10 To determine which scope 3 activities are most significant in size, companies should follow these steps:
11

- 12 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
13 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
14 scope 3 emissions.
15 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
16 significant.
17

18 Companies may use either:
19

- 20 • An emissions-based screening assessment, or
21 • A financial-based screening assessment.
22

23 Companies should give preference to an emissions-based screening assessment over a financial-based
24 screening assessment, since an emissions-based approach more closely approximates actual emissions.
25

26 Companies shall account for and report the largest scope 3 sources that collectively account for at least
27 80% of total anticipated scope 3 emissions.⁴⁰
28

29 **10.2.1. Emissions-based screening assessments**
30

- 31 • For each equity investment: Equity share in company/project (%) x estimated emissions for
32 company/project (tonnes CO₂-e)
33

34 **10.2.2 Financial-based screening assessments**
35

- 36 • Share (%) of total equity assets not included in the company's organizational boundary (i.e.
37 scope 1 and 2 emissions)
38 • Fixed asset investments as a share (%) of total equity assets
39

40 **10.2.3 Other Criteria for Determining Relevant Emissions**
41

42 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
43 emissions in terms of size, companies should consider other criteria to determine whether additional
44 scope 3 activities should be accounted for and reported.
45

46 Scope 3 activities should be considered relevant if they meet any of the following criteria:
47

- 48 1. There are potential emissions reductions that could be undertaken or influenced by the company
49 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
50 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
51 physical risks)

⁴⁰ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 1 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
2 investors or civil society)
- 3 4. They are an outsourced activity that is typically insourced by other companies in the reporting
4 company's sector
- 5 5. They meet additional criteria developed by the company or industry sector

6
7 **10.3 Calculating emissions**

8
9 **10.4 Case studies and examples**

10
11

1

2 **Downstream Emissions**

3 Downstream emissions are the emissions that occur in the life cycle of outputs (i.e., sold goods and
4 services) subsequent to sale by the reporting company. These include the scope 1 and 2 emissions of a
5 company's customers. Downstream emissions include the distribution, use, and disposal of sold products.

6 **11. Franchises (Downstream)**

7 **11.1 Description**

8 This category includes emissions from the manufacturing/construction and operation of franchises,
9 reported by the franchisor.

- 10 • *Note: This category is only applicable to companies that have franchises.*
- 11 • *Note: This category is reported by the franchisee, not the franchisor. (Franchisors should refer
12 to Section 8 of Part 2).*

13 A reporting company's scope 3 emissions from franchises (downstream) are the scope 1, 2 and 3
14 emissions of the franchisee.

15 **11.2 Determining relevant emissions**

16 To determine which scope 3 activities are most significant in size, companies should follow these steps:

- 17 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
- 18 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
19 scope 3 emissions.
- 20 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
21 significant.

22 Companies may use either:

- 23 • An emissions-based screening assessment, or
- 24 • A financial-based screening assessment.

25 Companies should give preference to an emissions-based screening assessment over a financial-based
26 screening assessment, since an emissions-based approach more closely approximates actual emissions.

27 Companies shall account for and report the largest scope 3 sources that collectively account for at least
28 80% of total anticipated scope 3 emissions.⁴¹

29 **11.2.1. Emissions-based screening assessments**

- 30 • Conservative method: Number of franchises x emissions of highest emitting franchise (tonnes
31 CO₂-e)
- 32 • Average method: Number of franchises x industry average emissions per franchise (tonnes
33 CO₂-e)

⁴¹ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 1 • For commercial assets (office, warehouse, retail) & light manufacturing:: floor space (sq m) x
2 published average emission factor (kg CO₂e /sq m) by building type
3

4 **11.2.2 Financial-based screening assessments**
5

- 6 • Revenues from franchise-operated operations as a share of your organization's total revenues
7 (%)
8

9 **11.2.3 Other Criteria for Determining Relevant Emissions**
10

11 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
12 emissions in terms of size,⁴² companies should consider other criteria to determine whether additional
13 scope 3 activities should be accounted for and reported.
14

15 Scope 3 activities should be considered relevant if they meet any of the following criteria:
16

- 17 1. There are potential emissions reductions that could be undertaken or influenced by the company
18 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
19 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
20 physical risks)
21 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
22 investors or civil society)
23 4. They are an outsourced activity that is typically insourced by other companies in the reporting
24 company's sector
25 5. They meet additional criteria developed by the company or industry sector
26

27 **11.3 Calculating emissions**
28

29 **11.4 Case studies and examples**
30

31 **12. Leased Assets (Downstream)**
32

33 **12.1 Description**
34

35 Emissions from the manufacturing, construction, or operation of leased assets not included in the lessor's
36 scope 1 or 2 emissions.
37

- 38 • *Note: This category is only applicable to companies that own assets that are leased to other
39 entities.*

40 A reporting company's scope 3 emissions from leased assets (downstream) are the scope 1, 2 and 3
41 emissions of the lessee.
42

43 **12.2 Determining relevant emissions**
44

45 To determine which scope 3 activities are most significant in size, companies should follow these steps:
46

- 47 1. Use screening methods to individually estimate the emissions from all scope 3 activities.
48 2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated
49 scope 3 emissions.
50

51 ⁴² Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of
52 Sold Products)

- 1 3. Rank all scope 3 activities from largest to smallest to determine which activities are most
2 significant.

3 Companies may use either:

- 4 • An emissions-based screening assessment, or
5 • A financial-based screening assessment.

6 Companies should give preference to an emissions-based screening assessment over a financial-based
7 screening assessment, since an emissions-based approach more closely approximates actual emissions.

8 Companies shall account for and report the largest scope 3 sources that collectively account for at least
9 80% of total anticipated scope 3 emissions.⁴³

10 **12.2.1. Emissions-based screening assessments**

- 11 • Conservative method: Number of leased assets x emissions of highest emitting leased asset
12 (tonnes CO₂-e)
13 • Average method: Number of leased asset x industry average emissions per leased asset
14 (tonnes CO₂-e)
15 • For commercial assets (office, warehouse, retail) & light manufacturing: floor space (sq m) x
16 published average emission factor (kg CO₂-e/sq m) by building type

17 **12.2.2 Financial-based screening assessments**

- 18 • Revenues from leased assets as a share of your organization's total revenues (%)

19 **12.2.3 Other Criteria for Determining Relevant Emissions**

20 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
21 emissions in terms of size, companies should consider other criteria to determine whether additional
22 scope 3 activities should be accounted for and reported.

23 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 24 1. There are potential emissions reductions that could be undertaken or influenced by the company
25 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
26 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
27 physical risks)
28 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
29 investors or civil society)
30 4. They are an outsourced activity that is typically insourced by other companies in the reporting
31 company's sector
32 5. They meet additional criteria developed by the company or industry sector

33 **12.3 Calculating emissions**

34 **12.4 Case studies and examples**

43 Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

13. Transportation & Distribution (Downstream / Outbound)

13.1 Description

This category includes the emissions from transportation and distribution (including warehousing) of sold products in vehicles, warehouses and other facilities not under the ownership or control of the reporting company.

This category includes the emissions from:

13.1 Transportation & distribution of sold products in vehicles not owned or controlled by the reporting company

13.2 Warehousing & storage of sold products in warehouses and other facilities not owned or controlled by the reporting company

13.3 Retail of sold products in facilities not owned or controlled by the reporting company

A reporting company's scope 3 emissions from transportation and distribution are the scope 1 and 2 emissions of third party logistics providers, retailers, etc. .

13.2 Determining relevant emissions

To determine which scope 3 activities are most significant in size, companies should follow these steps:

1. Use screening methods to individually estimate the emissions from all scope 3 activities.
2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated scope 3 emissions.
3. Rank all scope 3 activities from largest to smallest to determine which activities are most significant.

Companies should use an emissions-based screening assessment for downstream transportation and distribution, since financial-based screening assessments are not applicable.

Companies shall account for and report the largest scope 3 sources that collectively account for at least 80% of total anticipated scope 3 emissions.⁴⁴

13.2.1. Emissions-based screening assessments

13.1 Transportation and distribution of sold products	<ul style="list-style-type: none"> • For each product category: Mass or volume of sold products by transport mode (tonne) x average distance traveled (km) x average emission factor (kg CO₂-e per tonne-km) by mode; or • For each transportation mode (i.e., air, rail, truck, barge): total distance travelled (km) x total quantity transported (tonnes) x industry average emission factor (kg CO₂-e/tonne-km)
13.2 Warehousing of sold products	<ul style="list-style-type: none"> • Number of third party warehouses used to store products outbound of your company x conservative estimated storage space per warehouse (m³) x industry average emission factor (kg CO₂-e/m³)

⁴⁴ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

13.3 Retail of sold products	<ul style="list-style-type: none"> Number of third party retail sites used to sell products x conservative estimated storage space per site (m^3) x industry average emission factor (kg CO₂-e/m^3)
------------------------------	---

1 **13.2.2 Financial-based screening assessments**

2

- 4

5 **13.2.3 Other Criteria for Determining Relevant Emissions**

6

7 In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3
 8 emissions in terms of size,⁴⁵ companies should consider other criteria to determine whether additional
 9 scope 3 activities should be accounted for and reported.

10 Scope 3 activities should be considered relevant if they meet any of the following criteria:

- 11 1. There are potential emissions reductions that could be undertaken or influenced by the company
 12 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
 13 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
 14 physical risks)
 15 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
 16 investors or civil society)
 17 4. They are an outsourced activity that is typically insourced by other companies in the reporting
 18 company's sector
 19 5. They meet additional criteria developed by the company or industry sector

20 **13.3 Calculating emissions**

30

31

⁴⁵ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

1

2 **14. Use of Sold Products**

3 **14.1 Description**

4 This category includes emissions from the use of products sold by the reporting company.

5
6 The emissions from a company's products in their use phase is a core element of the value chain
7 emissions of a company. The use phase can be one of the most significant sources of emissions in the
8 life cycle of products (e.g. fuels, cars, electrical and electronic equipment). In some cases, use phase
9 emissions are an order of magnitude greater than emissions from manufacturing.

10 Reporting on product use phase emissions is in accordance with the concept of product stewardship,
11 where the manufacturer takes responsibility for the environmental performance of products beyond the
12 manufacturer's gate.

13 A reporting company's scope 3 emissions from the use of sold products are the scope 1 and 2 emissions
14 of the customer or end user.

15 **14.2 Determining relevant emissions**

16 Emissions from the use of sold products shall be reported for the following product types:

- 17
- 18 • Products that consume energy (fuels or electricity) during use
 - 19 • Fuels
 - 20 • Products that contain GHGs that are emitted during use

21 Companies should report emissions from the use of sold products for other product types where the
22 company has determined them to be relevant (see Table 14.1).

23 Emissions from the use of sold products shall be reported for all final products and for those intermediate
24 products where the eventual end use of the product is known.

25 Reporting emissions from the use of sold products is not required for raw materials and intermediate
26 products where the eventual end use of the product is unknown.⁴⁶

27 Emissions from the use of sold products should optionally be reported for raw materials and intermediate
28 products, where relevant.

29 **Box 14.1. Final Products and Intermediate Products**

30 **Intermediate products** are goods that are used as inputs in the production of other goods and services
31 rather than entering the use stage in their current form. Intermediate products require further processing,
32 transformation within the system, or inclusion in another product system before the use stage.
33 Examples include steel bars, microchips, electrical motors, metals, resins, plastics, and machinery
34 components (e.g., ball bearings).

35 **Final products** are goods and services that are ultimately consumed by the end user rather than used
36 in the production of another good or service. Final products enter the use stage in their current form
37 without further processing, transformation within the system, or inclusion in another product system
38 before the use stage. Examples include a car, laptop computer, or vacuum cleaner.

40⁴⁶ For example, a manufacturer of plastic resin may sell its product to a customer without knowing
41 whether the plastic resin may eventually be transformed into plastic bottles, car parts, laptops, etc.

In some cases, the end user is a company producing other goods. These products are considered final goods rather than intermediate goods. Examples include catalysts, turbines, fuels, etc.

Products (e.g., consumer products) sold to retailers to be sold to consumers are final products because they are not processed or transformed before the use stage.

Table 14.1: Emissions from Use of Sold Products: Reporting Requirements by Product Type

1. Consumes energy (fuels or electricity) during use	Automobiles, aircraft, engines, motors, buildings, appliances, electronics, lighting	Report all
2. Fuels	Petroleum products, natural gas, coal, biofuels	Report all
3. Contains GHGs that are emitted during use	Aerosols, refrigerants, industrial gases, SF6, HFCs, PFCs, fire extinguishers	Report all
4. Indirectly consumes energy during use	Pots & pans (heating), textiles (washing), food (refrigeration)	Optional <i>Should report if significant in size, if the company has the ability to influence reductions, or if otherwise relevant</i> ⁴⁷
5. Other products that emit GHGs directly or indirectly during use	Fertilizers Financial products/services Others	Optional <i>Should report if significant in size, if the company has the ability to influence reductions, or if otherwise relevant</i>
6. Raw materials and intermediate goods where the eventual end use is unknown	Iron ore, cement	Optional
7. No GHG impact in the use phase	Furniture	Optional
8. When used, reduces the GHGs of other entities compared to a baseline	Wind turbine or solar panel (compared to coal plant); ICT (compared to air travel); CFL bulb (compared to incandescent bulb)	Optional <i>Report separately from scopes 1, 2, and 3</i>

⁴⁷ i.e., if reporting enables the reporting company to understand the emissions-intense areas of its value chain and the users of data to understand the relative impact of the company's value chain emissions and reduction activities.

1
2 **14.3 Calculating emissions**
3

4 Product use phase emissions should be calculated as the total expected lifetime emissions from all
5 relevant products sold in the reporting year (e.g., the previous calendar year).
6

7 **Example 14.1**
8

9 An automaker manufactures one million cars in 2009. Each car has an expected lifetime of ten years. In
10 the company reports the anticipated use phase emissions of the one million cars it produced in
11 2009 over their ten year expected lifetime.
12

13 Calculations of use phase emissions shall be based on sources listed below:
14

- 15 1. Published international standards that specify a use phase for the product;
- 16 2. Published national guidelines that specify a use phase for the product;
- 17 3. Published sector-specific guidelines that specify a use phase for the product being assessed.

18 Where no method for determining the use phase of products has been established in accordance with
19 points 1-3 above, the approach taken shall be established by the reporting company.
20

21 *Note: It is anticipated that, over time, sector-specific guidelines and other published material will
increasingly form the basis of use phase emissions assessments.*
22

23 The use phase and associated emissions may vary significantly from region to region: Use profiles should
24 therefore specify the region(s) that they represent. To keep things simple, it is recommended that only the
most common or average use case is described, with clear assumptions such as:
25

- 26 • Average temporal duration;
- 27 • Average amount of energy required;
- 28 • Type of energy/fuel used;
- 29 • Assumed average emission factors.

30 **Example 14.2**
31

32 Company A manufactures a product that uses electricity during its use phase. There are no sector-
33 specific guidelines or other guidelines to specify the use phase of this product. However, company A has
34 undertaken research regarding the durability of the product as well as patterns of usage among a large
35 sample of customers. The product has an average life span of 5 years. The average user works with the
36 product 3 hours per working day. The power consumption is 0.5 kWh per hour. The emission factor for
the country the product is used in is 0.5 kg CO₂e/kWh. Based on this information, company A calculates
the emissions associated with the use phase of their product.
37

38 *Calculation of total GHG emissions associated with this product:*
39

$$5 \text{ years} \times 200 \text{ working days} \times 2 \text{ hours/day} \times 0.5 \text{ kWh} \times 0.5 \text{ kg CO}_2\text{e/kWh} = 500 \text{ kg CO}_2\text{e}$$

1
2 **Table 14.2: Emissions from Use of Sold Products: Examples of Calculations Methods by Product**
3 **Type**

Consumes fossil fuels in the use phase	Automobiles, engines, motors, buildings	Energy efficiency (Btu/hour) x average use (hours/year) x life span (years) x emission factor (GHG/Btu)
1. Consumes electricity in the use phase	Appliances, electronics, lighting, buildings	Energy efficiency (kW/hour) x average use (hours/year) x life span (years) x emission factor (GHG/kW)
Fossil fuels	Petroleum products, natural gas, coal	Quantity sold (tonnes) x emission factor (GHG/tonne)
Contains GHGs that are emitted during use	Aerosols, refrigerants, industrial gases, SF6, HFCs, PFCs, fire extinguishers	GHG contained per product (GHG/unit) x quantity sold (units)

5 **Reporting of Data and Assumptions Used**

6 Estimates of emissions from the use of sold product can vary widely depending on the assumptions and
 7 data used. The calculation of downstream emissions should be based on standardized assumptions and
 8 methodologies using publicly available data sets where available (e.g. from government agencies,
 9 industry groups, etc.). Companies shall disclose the calculation methodologies, assumptions, and data
 10 sets used to estimate emissions.

11 **Reporting Additional Metrics**

12 Companies should report additional information where relevant such as the energy or GHG efficiency of
 13 sold products, levels of product certification (e.g. Energy Star in the US), the relative impact of product
 14 use phase emissions compared to scope 1 and scope 2 emissions, etc.

15 **14.4 Case studies and examples**

16 **15. Disposal of Sold Products at the End of Life**

17 **15.1 Description**

18 This category includes emissions from the disposal of discarded finished products.

19 A reporting company's scope 3 emissions from disposal of sold products at the end of life are the scope
 20 1, 2 and 3 emissions of the waste management organization or wastewater treatment plant.

21 Disposal of wastes (landfilling, combustion) results in potentially significant greenhouse gas emissions.
 22 Landfilling of organic wastes results in anaerobic decomposition and methane generation, a greenhouse
 23 gas with a higher global warming potential than CO₂. Combustion of fossil based components without
 24 energy recovery constitutes disposal and releases fossil based CO₂ emissions. Transportation of wastes
 25 from the point of generation to the disposal site also result in greenhouse gas emissions.

26 **15.2 Determining relevant emissions**

To determine which scope 3 activities are most significant in size, companies should follow these steps:

1. Use screening methods to individually estimate the emissions from all scope 3 activities.
2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated scope 3 emissions.
3. Rank all scope 3 activities from largest to smallest to determine which activities are most significant.

Companies should use an emissions-based screening assessment for this category, since financial-based screening assessments are not applicable.

Companies shall account for and report the largest scope 3 sources that collectively account for at least 80% of total anticipated scope 3 emissions.⁴⁸

15.2.1. Emissions-based screening assessments

- Estimated mass of finished goods x Average carbon content of waste (30% default) x average methane content of landfill gas (0.5 default) x 16/12 x CH₄ Global Warming Potential

15.2.2 Financial-based screening assessment

- N/A

15.2.3 Other Criteria for Determining Relevant Emissions

In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3 emissions in terms of size,⁴⁹ companies should consider other criteria to determine whether additional scope 3 activities should be accounted for and reported.

Scope 3 activities should be considered relevant if they meet any of the following criteria:

1. There are potential emissions reductions that could be undertaken or influenced by the company
2. They contribute to the company's risk exposure (e.g., climate change related risks such as financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and physical risks)
3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers, investors or civil society)
4. They are an outsourced activity that is typically insourced by other companies in the reporting company's sector
5. They meet additional criteria developed by the company or industry sector

15.3 Calculating emissions

15.4 Case studies and examples

⁴⁸ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

⁴⁹ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

Other Scope 3 Emissions

Other scope 3 emissions are limited to employee activities such as commuting, which are neither purchased nor sold. These include the scope 1 and 2 emissions of a company's employees.

16. Employee Commuting

16.1 Description

Employee commuting includes the travel of employees between their homes and primary worksites or between their homes and alternate worksites.

This category may also include other employee activities such as teleworking (i.e., employees working from home in a formal or ad hoc teleworking program).

A reporting company's scope 3 emissions from employee commuting are the scope 1, 2 and 3 emissions of its employees.

16.2 Determining relevant emissions

To determine which scope 3 activities are most significant in size, companies should follow these steps:

1. Use screening methods to individually estimate the emissions from all scope 3 activities.
2. Express each individual scope 3 activity's estimated emissions as a fraction of total anticipated scope 3 emissions.
3. Rank all scope 3 activities from largest to smallest to determine which activities are most significant.

Companies should use an emissions-based screening assessment for employee commuting, since financial-based screening assessments are not applicable.

Companies shall account for and report the largest scope 3 sources that collectively account for at least 80% of total anticipated scope 3 emissions.⁵⁰

16.2.1. Emissions-based screening assessment

- Total number of employees x average (conservative) distance from place of work (km) x 10 trips per week x 52 weeks per year x national average emission factor of private vehicle (kg CO₂-e/passenger-km)

16.2.2. Financial-based screening assessment

- N/A

16.2.3 Other Criteria for Determining Relevant Emissions

In addition to accounting for all activities that collectively account for 80% of total anticipated scope 3 emissions in terms of size, companies should consider other criteria to determine whether additional scope 3 activities should be accounted for and reported.

Scope 3 activities should be considered relevant if they meet any of the following criteria:

⁵⁰ Exclusive of Category 1 (Purchased Goods and Services – Direct Supplier Emissions) and Category 14 (Use of Sold Products)

- 1 1. There are potential emissions reductions that could be undertaken or influenced by the company
- 2 2. They contribute to the company's risk exposure (e.g., climate change related risks such as
- 3 financial, regulatory, supply chain, product and technology, compliance/litigation, reputational and
- 4 physical risks)
- 5 3. They are deemed critical by key stakeholders (e.g., feedback from customers, suppliers,
- 6 investors or civil society)
- 7 4. They are an outsourced activity that is typically insourced by other companies in the reporting
- 8 company's sector
- 9 5. They meet additional criteria developed by the company or industry sector

13.3 Calculating emissions

Calculating emissions from employee commuting involves multiplying activity data (i.e., person-kilometers travelled by mode of transport) by emission factors (typically default national emission factors by mode of transport). Modes of transport include rail, subway, bus, automobile, bicycle, walking, etc.

Companies should survey their employees annually to obtain information on average commuting habits. The company should seek information on:

- Average one-way distance traveled by employee per day
- Mode(s) of transport used by employees

Companies should collect employee commuting data from as many employees as possible. However, for large organizations, some use of extrapolation may be necessary. Companies may extrapolate from a representative sample of employees to represent the total commuting patterns of all employees.

Companies should convert daily commuting distance into annual commuting distance by multiplying the one-way distance by two for the return trip and by the number of days worked per year (i.e., excluding weekends and days spent on business travel, on vacation, working from home, etc). The activity data should be summed to obtain total annual person-kilometers traveled by each mode of transport.

For a sample survey, refer to:

- GHG Protocol Calculation Tool, "CO₂ Emissions from Employee Commuting. Version 2.0. June 2006" Developed by World Resources Institute, available at <http://www.ghgprotocol.org>.

To calculate emissions from employee commuting, refer to:

- GHG Protocol Calculation Tool, "CO₂ Emissions from Employee Commuting. Version 2.0. June 2006" Developed by World Resources Institute, available at <http://www.ghgprotocol.org>.
- US EPA Climate Leaders GHG Inventory Protocol, "Optional Emissions from Commuting, Business Travel and Product Transport," available at: http://www.epa.gov/stateply/documents/resources/commute_travel_product.pdf

1
2 **16.4 Case studies and examples**
3

4 World Resources Institute: Scope 3 Emissions from Employee Commuting, 2007

		Source of emissions	Activity data	Emission factor	Metric tons of CO ₂
Scope 3 (employee commuting)		Bus	23,011 miles	0.30 kg of CO ₂ /mile	7
		Metro	225,201 miles	0.17 kg of CO ₂ /mile	38
		Commuter rail	150,423 miles	0.31 kg of CO ₂ /mile	47
		Car	2,254 gallons of gas	8.87 kg of CO ₂ /gallon	20
		Walk/bike	39,192 miles	0	0
				Total	112 tCO₂

5
6 Note: The emission factors in the table above are illustrative only and should not be used to calculate
7 emissions. Refer to the tools referenced above for the most up-to-date emission factors.

8

Glossary

Term	Definition
Activity data	<p>A quantitative measure of a level of activity that results in GHG emissions or removals. Examples of activity data include kilowatt-hours of electricity used, volume of fuel used, output of a process, hours a piece of equipment is operated, distance travelled, and area of a building.</p> <p>Activity data are multiplied by an emissions factor to derive the GHG emissions associated with a process or an operation.</p>
Assurance	<p>When an assurance provider expresses a conclusion designed to enhance the degree of confidence of the intended users (other than the preparer of the GHG inventory report) over the measurement of the GHG inventory and the Scope 3 emissions included therein against defined criteria.</p>
Audit trail	<p>Well organized and transparent historical records documenting how an inventory was compiled.</p>
CO₂ equivalent (CO₂-e)	<p>The universal unit of measurement to indicate the global warming potential (GWP) of each of the six greenhouse gases, expressed in terms of the GWP of one unit of carbon dioxide. It is used to evaluate releasing (or avoiding releasing) different greenhouse gases against a common basis.</p>
Control	<p>The ability of a company to direct the policies of another operation. More specifically, it is defined as either operational control (the organization or one of its subsidiaries has the full authority to introduce and implement its operating policies at the operation) or financial control (the organization has the ability to direct the financial and operating policies of the operation with a view to gaining economic benefits from its activities).</p>
Downstream emissions	<p>Indirect GHG emissions that occur in the life cycle of outputs (i.e., sold goods and services) subsequent to sale by the reporting company.</p>
Emission factor	<p>A factor allowing GHG emissions to be estimated from a unit of available activity data (e.g. tonnes of fuel consumed, tonnes of product produced) and absolute GHG emissions.</p>
Emissions	<p>The release of GHG into the atmosphere.</p>
Extrapolated data	<p>Primary or secondary data related to a similar (but not representative) input, process, or activity to the one in the inventory, which are adapted or customized to a new situation to make more representative (for example, by customizing the data to the relevant region, technology, process, temporal period and/or product).</p>
Final product	<p>Goods and services that are ultimately consumed by the end user rather than used in the production of another good or service. Final products enter the use stage in their current form without further processing, transformation within the system, or inclusion in another product system before the use stage.</p>
Global Warming Potential (GWP)	<p>A factor describing the radiative forcing impact (degree of harm to the atmosphere) of one unit of a given GHG relative to one unit of CO₂.</p>
Greenhouse gas inventory	<p>A quantified list of an organization's GHG emissions and sources.</p>
Greenhouse gases (GHG)	<p>For the purposes of this standard, GHGs are the six gases listed in the Kyoto Protocol: carbon dioxide (CO₂); methane (CH₄); nitrous oxide (N₂O); hydrofluorocarbons (HFCs); perfluorocarbons (PFCs); and sulphur hexafluoride (SF₆).</p>
Intermediate product	<p>Goods that are used as inputs in the production of other goods and services rather than entering the use stage in their current form. Intermediate products require further processing, transformation within the system, or inclusion in another product system before the use stage.</p>

Life cycle	Consecutive and interlinked stages of a product system, from raw material acquisition or generation of natural resources to end of life.
Material discrepancy	An error (for example, from an oversight, omission, miscalculation or fraud) that results in a reported quantity or statement being sufficiently different from the true value or meaning to influence a user's decisions.
Materiality threshold	A concept employed in the process of verification. It is often used to determine whether an error or omission is a material discrepancy or not. It should not be viewed as a de minimus for defining a complete inventory.
Operational boundaries	The boundaries that determine the direct and indirect emissions associated with operations owned or controlled by the reporting company. This assessment allows a company to establish which operations and sources cause direct and indirect emissions, and to decide which indirect emissions to include that are a consequence of its operations.
Organizational boundaries	The boundaries that determine the operations owned or controlled by the reporting company, depending on the consolidation approach taken (equity or control approach).
Outsourcing	The contracting out of activities to other businesses.
Primary data	Direct emissions measurements or activity data collected from specific processes within a product's life cycle or specific sources within a company's operations or its supply chain.
Product	Any good or service.
Proxy data	Primary or secondary data related to a similar (but not representative) input, process, or activity to the one in the inventory, which are directly transferred or generalized to the input, process, or activity of interest without being adapted or customized to make more representative.
Reporting	Presenting data to internal management and external users such as regulators, shareholders, the general public or specific stakeholder groups.
Scope	Defines the operational boundaries in relation to indirect and direct GHG emissions.
Scope 1 Inventory	A reporting organization's direct GHG emissions
Scope 2 Inventory	A reporting organization's emissions associated with the generation of electricity, heating/ cooling, or steam purchased for own consumption.
Scope 3 Inventory	A reporting organization's indirect emissions other than those covered in scope 2. A company's scope 3 inventory includes the upstream and downstream emissions of the reporting company.
Secondary data	Data that are not collected from specific processes within a product's life cycle or specific sources within a company's operations or its supply chain. Secondary data include industry-average data, data from literature studies, and data from published databases.
Supply chain	A network of organizations (e.g., manufacturers, wholesalers, distributors and retailers) involved in the production, delivery, and sale of a product to the consumer.
Uncertainty	1. Statistical definition: A parameter associated with the result of a measurement that characterizes the dispersion of the values that could be reasonably attributed to the measured quantity. (e.g. the sample variance or coefficient of variation). 2. Inventory definition: A general and imprecise term which refers to the lack of certainty in emissions-related data resulting from any causal factor, such as the application of non-representative factors or methods, incomplete data on sources and sinks, lack of transparency etc. Reported uncertainty information typically specifies a quantitative estimates of the likely or perceived difference between a reported value and qualitative description of the likely causes of the difference.
Upstream emissions	Indirect GHG emissions that occur in the life cycle of inputs (i.e., purchased or acquired goods, services, materials, and fuels), up to the point of receipt by the

DRAFT FOR ROAD TESTING – JANUARY 2010

	reporting company.
Value chain emissions	The total scope 1, scope 2, and scope 3 emissions of a company, including emissions from the upstream and downstream activities associated with the operations of the reporting company.
